**Prairie Farm Assistance Act.**—The Prairie Farm Assistance Act, 1939 (RSC 1970, c. P-16), provides for direct money payments by the Federal Government on an acreage-and-yield basis to farmers in areas of low crop yield in the Prairie Provinces and in the Peace River area of British Columbia. Its purpose is to assist in dealing with a relief problem which faces municipalities when widespread crop disasters reduce crop yields over a large area. The per acre payments are intended to assist farmers to seed a crop in the following year. Payments for the year ended Mar. 31, 1971 totalled \$7,357,980; payments made under the Act since 1939 amounted to \$389,426,000.

Payments are made from the Prairie Farm Emergency Fund to which farmers contribute 1 p.c. of the value of all sales of wheat, oats, barley, rye, flaxseed and rapeseed. The additional funds required are provided from the federal treasury. The total collected from the 1-p.c. levy in the year ended Mar. 31, 1971 was \$6,935,572; the amount collected since 1939 was \$211,094,643.

Farmers operating land in the spring wheat area, and not covered by a federal-provincial crop insurance scheme, are eligible for awards. Crop failure and natural causes preventing seeding and summerfallowing are taken into account in making awards. These may not exceed \$800 in respect of any one farmer's total cultivated acreage.

The PFAA administered the Operation LIFT program in 1970. This program offered acreage payments to farmers who reduced acreage seeded to wheat and increased acreage seeded to perennial forage or summerfallow and was introduced by the Federal Government to alleviate problems arising from the surplus of wheat in storage. Payments made to farmers under the program as of July 1971 amounted to \$57,900,000. The PFAA also administers the forage program introduced in 1971, which offers an incentive of \$10 an acre to farmers who change their farm production from grains, oilseeds and other crops to perennial forage.

**Livestock Feed Assistance Act.**—The Livestock Feed Assistance Act, 1966-67 (RSC 1970, c. L-9) established the Canadian Livestock Feed Board, which is a Crown agency reporting to Parliament through the Minister of Agriculture. The Board has four main objects, which are to ensure: (1) the availability of feed grain to meet the needs of livestock feeders; (2) the availability of adequate storage space in Eastern Canada for feed grain to meet the needs of livestock feeders; (3) reasonable stability in the price of feed grain in Eastern Canada and in British Columbia; and (4) fair equalization of feed grain prices in Eastern Canada and in British Columbia.

In furtherance of these objectives, the Board may make payments related to the cost of feed grain storage and transportation. Feed grain transportation assistance payments have been made since 1941, and since April 1967 have been made under the authority of the Livestock Feed Assistance Act. Under the Feed Grain Assistance Regulations of the Appropriations Act, the original policy was initiated in October 1941 to provide a market for western feed grains, and to enable livestock feeders in Eastern Canada and British Columbia to obtain supplies of feed grains at a cost that would maintain livestock and poultry production at a high level. This program has been modified over the years to encourage better utilization of both transport and storage facilities.

**6.—Freight-Assisted Shipments of Feed Grains, by Province of Destination,  
Years Ended Mar. 31, 1970 and 1971**

<sup>1</sup> Includes Manitoba corn shipped into British Columbia.

**The Small Farms Development Program.**—In addition to the above-mentioned legislation providing farm assistance, another type of assistance was considered necessary by both the federal and provincial governments. Because economic forces were driving thousands of farmers off the land and promoting the evolution of big farms requiring high investment, there was an urgent need for the development of new and workable programs to assist the small farmer to remain on the land and to raise his operations above the poverty level, or to retire from farming without abandoning his farm home or rural municipality. Thus, in late 1971, the Small Farms Development Program was initiated for which the Federal Government earmarked \$150,000,000 to be spent over the first seven years of the program. Through extended credit facilities, the small farmer will gain access to the funds he requires to secure additional land or equipment in order to develop a profitable business; through programs currently being worked out with the provincial departments of agriculture, the information and services he needs in so doing will be available to him; if he desires to sell his farm he will qualify for an adjustment grant that will be added to the selling price of the land, which will then be released to others wishing to acquire it, either for farming or for such other uses as reforestation or recreation. In carrying out the program, arrangements will be made for integration with such existing services as those provided under the federal-provincial ARDA agreements, manpower training programs, adult education and training programs, farm management programs, and proposals for provincial land banks.

### Section 3.—Provincial Governments in Relation to Agriculture\*

#### Subsection 1.—Agricultural Services

**Newfoundland.**—Government agricultural services in Newfoundland are operated by the Division of Agriculture and Food of the Department of Mines, Agriculture and Resources. The Division consists of six directors and a staff of 125 under the administration of the Deputy Minister of Agriculture and Food. For purposes of administration, the province is divided into a number of districts in each of which is located a fieldman. Officers in charge of different phases of agricultural development visit each district on assignments from the St. John's office.

Departmental policies in support of the agricultural industry include: a bonus of \$125 an acre on land cleared by privately owned equipment; the distribution of ground limestone at a subsidized rate; the payment of bonuses on purebred sires; and financial assistance to agricultural societies, marketing organizations, and exhibition committees.

Favourable marketing conditions and departmental assistance and loans under the Provincial Farm Development Loan Board, the Newfoundland Marketing Board and the Newfoundland Farm Products Corporation have contributed to increased output of agricultural products in the province.

**Prince Edward Island.**—The Prince Edward Island Department of Agriculture is composed of the following Branches and Divisions. The Extension Services Branch deals with rural extension education generally, through its three Divisions: the Agricultural Economics and Statistics Division; the Agricultural Representative Division which has five district offices, each with an agricultural representative, a home economist and a farm management specialist; and a Women and Youth Division, which includes an Information Section. The Production Sciences Branch supervises the regulatory function of the Department and assists with agricultural extension programs. It has three Divisions: the Soils and Water Division, the Production Science Division and the Veterinary and Dairy Services.

The Department of Agriculture is also responsible for the forestry program in the province, which function comprises a third Branch of the Department; it is described in Chapter XIII under "Provincial Forestry Programs".

\* Prepared by the agriculture officials of the respective provincial governments.

**Nova Scotia.**—The Department of Agriculture and Marketing endeavours to “help the people to help themselves” through strengthening member interest in such organizations as the Nova Scotia Federation of Agriculture, the Nova Scotia Fruit Growers’ Association, various agricultural co-operative organizations, credit unions and producer and marketing organizations.

**New Brunswick.**—Provincial government agricultural policy and programs in New Brunswick are administered and directed by the Department of Agriculture and Rural Development. Under the Minister of Agriculture and Rural Development, the Department is administered by a deputy minister, an assistant deputy minister and the directors of Branches concerned with: extension, livestock and dairying, veterinary services, poultry, plant industry, agricultural engineering, home economics, credit unions and co-operatives, agricultural education and rural development. The Department also has a Farm Economics Division and an Information Division, as well as a Farm Adjustment Board and a Dairy Products Commission.

**Quebec.**—Agricultural policies of the Quebec Government, as applied by the Department of Agriculture and Colonization, are based on one overriding and clearly defined objective—to make agriculture profitable and bring it into line with the social and economic needs of the 1970s.

Its prime target is, therefore, a systematic modernization of farms. Government, in co-operation with agricultural and related associations, is trying to increase and improve production. It is also attempting to guide agriculture along truly professional lines, through conversion of production techniques to meet local needs and skills, through sound land-use development policies, and through adult education and practical management training in agricultural study groups.

To carry out this objective, the Quebec Department of Agriculture is divided into three main Branches—the Secretariat of the Department, the Production and Veterinary Services Branch and the Administrative Services, Research and Education Branch. Under the direction of the Minister, the Deputy Minister and three Assistant Deputy Ministers, these Branches work in co-operation with the scientific and technical services which function as a support group and also contribute to their general orientation.

The Secretariat of the Department assists in over-all planning and policy making by studying solutions to major administrative and technical problems, developing programs, preparing estimates, supervising the implementation of established departmental programs and conducting the necessary liaison with other provincial and federal departments and agencies concerned with agricultural matters.

The Production and Veterinary Services Branch is responsible for improving and increasing production. It is particularly concerned with farm reorganization through re-grouping and developing up-to-date and viable units. It exercises a direct influence on farmers through 12 well-organized regional administrative offices and laboratories.

The Administrative Services, Research and Education Branch supplies the manpower, co-ordinating labour relations, staff training and employee services and organizing promotional competitions through the Civil Service system. It also co-ordinates the activities of various administrative branches of the Department and, in co-operation with the Accounting Branch, prepares part of the estimates. In addition, it looks after the internal and external needs of the Department as regards supplies and equipment.

Each of these Branches operates in a specific field requiring the co-operation of other departmental services such as Legal, Accounting, Grants and Incentives, Agricultural Water Supplies, and Storage and Equipment on the administrative side, and Veterinary Services, Artificial Insemination and Herd Improvement, Farm Organization, Economics, Marketing, Education and Research, and Information services on the regional offices and laboratories side. Each therefore plays an important role in the efficient operation of the Department and contributes to its effectiveness in direct action in the field.

The entire departmental structure is rounded out with the Agricultural Marketing Board, Farm Credit Bureau, and Crop Insurance Board, which implement legislation for both the farmer and the consumer. A Crown corporation, the St. Hilaire Sugar Refinery, completes the organization; it promotes the growing of sugar beets in part of the green belt around Montreal.

**Ontario.**—The Ontario Department of Agriculture and Food conducts a wide variety of programs to develop a sound agricultural industry and to help farmers. Most assistance is through self-help programs which benefit the individual farmer. The Department administers 48 separate legislative Acts, some of which are regulatory on an industry-wide basis.

Through the Agricultural Rehabilitation and Development Branch (ARDA) the province shares equally with the Federal Government the cost of rural development. In Ontario, ARDA is heavily committed to farm enlargement and consolidation, capital grants for farm development, retraining and research programs, development of community pastures where farmers rent pasture at cost, and soil, water and forest conservation projects.

Agricultural Manpower Services assists in recruiting, moving and placing farm workers during the planting and harvesting seasons. This service operates under the Provincial Agricultural Manpower Agreement negotiated each year by the Federal Government and the provincial governments.

The Co-operative Loans Board makes loans to agricultural co-operative associations for the construction of cold storages, feed mills, processing plants, grain elevators, potato storages, dairies, creameries and cheese factories.

The Crop Insurance Commission of Ontario, a Branch of the Department, provides insurance against weather, insect and disease damage to winter wheat, spring grain, forage crops, grain corn, soybeans and white beans. The cost of administration is shared equally by the Federal and Ontario Governments and the premium rates are further subsidized to the extent of 25 p.c. by the Federal Government and 25 p.c. by the Ontario Government, effective in the autumn of 1971.

The Soils and Crops Branch conducts programs of applied research to provide farmers with specific recommendations for their areas. Soils and crops specialists frequently work with local branches of the Ontario Soil and Crop Improvement Association to relay this information to the farmers. Specialists also supervise the county weed inspectors who enforce the Weed Control Act and provide specialized advice to producers of horticultural crops in Ontario.

The programs of the Veterinary Services Branch fall into the categories of service and regulation. Services include administration of a mastitis control program, a certified herd policy for swine and veterinary assistance for designated areas (mostly in the northern districts); the Regulatory Division administers the Meat Inspection Act, the Brucellosis Act 1965, the Animal Contagious Diseases Act, the Livestock Community Sales Act, the Dead Animal Disposal Act, the Rabies Indemnification program, the Mastitis Control program, the Animals for Research Act and the Pregnant Mare Urine Farms Act. The Branch provides diagnostic services for livestock and poultry producers at five regional laboratories.

The Live Stock Branch supervises numerous livestock improvement programs and administers the Warble Fly Control Act, the Artificial Insemination Act, the Dog Tax and Live Stock and Poultry Protection Act, and the Hunter Damage Compensation Act. Livestock improvement programs include dairy herd improvement; beef cattle performance testing; quality meat sire policy; bull, boar and ram premium policies; production testing in sheep and the federal-provincial sheep transportation assistance policy; and northern Ontario livestock assistance. The Branch sponsors and endorses the Ontario Beef Cattle Improvement Association and the county and district associations, makes grants available to regional livestock clubs that hold sales of good quality breeding stock, and sponsors exhibits of livestock outside the province.

The Ontario Stock Yards Board, which operates under the Federal Livestock and Livestock Products Act, was established to provide a marketing service for Ontario livestock producers and to protect their bargaining power.

The Ontario Milk Commission, a Branch of the Department, is responsible for dairy programs. Under the Milk Act, 1965 and through the Ontario Milk Marketing Board and the Ontario Cream Producers' Marketing Board, the Commission is responsible for all producer marketing of milk and cream in the province. The Ontario Milk Marketing Board directs milk from farm to plant and establishes prices. The Commission administers the Farm Products Payments Act, 1967, the Oleomargarine Act, and the Edible Oil Products Act. It also carries out the milk quality program, audits plant records, and supervises the fluid milk, milk products and central milk testing programs. The Infra Red Milk Analyzer (IRMA) is the recognized method for determining milk fat content in Ontario. The Commission licenses processors and distributors, carries on extension work with producers, operates milk-testing laboratories for the purpose of calculating producer returns, certifies butter and cheese makers, graders and testers, and does inspection work on farm and in plant.

The Farm Products Inspection Branch promotes improved methods of disease control, grading, packaging, marketing, handling, storing and transporting Ontario farm produce. This is provided for under the Farm Products Grades and Sales Act and Regulations, and the Plant Diseases Act.

Under the Ontario Farm Products Marketing Board, a Branch of the Department of Agriculture and Food, 19 producer boards market 37 commodities with a total market value of approximately \$500,000,000 annually.

The Ontario Food Council Branch of the Department has the broad responsibility of finding methods to better co-ordinate marketing of Ontario farm products in Ontario, other Canadian provinces and abroad. The Council includes representatives of producers, processors, wholesalers, distributors and consumers. Market development, import replacement, and expansion of food information and consumer affairs services are major areas of the Council's work. The Ontario Food Terminal, operating under the Ontario Food Terminal Act, offers farmers the services of one of the largest volume wholesale fruit and vegetable markets in Canada.

Research and education are administered by the Education and Research Division of the Department. Under the Division, the Agricultural Research Institute of Ontario recommends and co-ordinates research for the betterment of agriculture, veterinary medicine and household science, undertakes continuous research on crops, livestock and farming practices, and administers a number of services. Horticultural research is co-ordinated by the Horticultural Research Institute of Ontario, which also operates under the Education and Research Division. Fruit and vegetable product development research, and fruit and vegetable variety research are the chief functions of the Institute. The Provincial Pesticide Residue Testing Laboratory tests samples of animal, vegetable and mineral origin for herbicides, fungicides and insecticides. The Laboratory continually tests milk collected from Ontario farms for pesticide residues. The Division is also responsible for five diploma-course programs at the Ontario Agricultural College at the University of Guelph, and at the Colleges of Agricultural Technology at Centralia, Kemptville, New Liskeard and Ridgeway.

The Provincial Entomologist reports on insect control programs, as provided under the Plant Diseases and Abandoned Orchards Act, to determine pest control recommendations for Ontario crops. The Provincial Apiarist is responsible for reporting on the bee and honey industry.

There are 54 county and district Extension Branch offices to serve Ontario farmers. These are staffed by agricultural representatives who relay information about agricultural research developments directly to farmers. In addition, specialists on farm management and engineering are located strategically throughout the province. The northern Ontario

assistance policies of the Department, which vary from year to year, are also administered by the Branch. The Branch endorses and assists the 4-H Clubs and the Junior Farmers' Association of Ontario.

The Home Economics Branch conducts an extension program for rural women's groups and for girls' 4-H homemaking clubs. The senior program deals with the study of foods, nutrition, clothing, textiles, home furnishings, home crafts and home management.

The Information Branch publishes and distributes several hundred publications covering most areas of agriculture in Ontario, as well as home gardening and homemaking. News releases, radio tapes and television are used to convey information on important changes in agriculture to farmers. Its film library distributes more than 2,000 films annually to the public. This Branch co-ordinates a Departmental Market Information Service which provides up-to-date commodity quotations and farm weather reports to the media and individual producers on a daily basis using radio and audio tape facilities.

The Agricultural and Horticultural Societies Branch advises and offers financial assistance to agricultural and horticultural societies and ploughmen's associations throughout the province and administers the Community Centres Act which authorizes grants to municipalities for capital investments in community centres and recreational facilities.

The Ontario Telephone Service Commission provides technical and management advice to the 51 Independent Telephone Systems (municipal and privately owned) operating in rural Ontario.

The Farm Economics, Co-operatives and Statistics Branch does research into marketing, policy, production, land use, and dairying; works with Statistics Canada to collect and publish statistics on farm production and marketing; and provides services to various Ontario agricultural co-operatives.

**Manitoba.**—The Department of Agriculture serves Manitoba through the following branches.

The Extension Service Branch deals with rural extension education generally and has specialists devoting attention particularly to agricultural engineering, entomology and beekeeping, radio, TV and information, 4-H Clubs and women's work, manpower and rural development. Meetings, field days, and short courses are held; 39 agricultural representatives and four assistants are located in 37 offices in the province, each serving from one to five municipalities, four manpower extension agents serve the Interlake region, and 15 home economists serve designated areas.

The Animal Industry Branch develops and administers policies that encourage the improvement and efficient production of different classes of livestock, including poultry, supervises the grading of cream and inspects dairy manufacturing plants. Several Acts to promote high quality products for consumer protection are administered in co-operation with federal departments.

The Soils and Crops Branch encourages the development, production and improvement of cereal, forage and special crops and horticulture and promotes proper land use through soil conservation programs. The Branch develops and administers policies that encourage good field crop husbandry, soil conservation, land development and weed control.

The Economics and Publications Branch deals with agricultural economics, supervises the farm business clubs and publishes and distributes annually approximately 250,000 bulletins, circulars, posters, leaflets, etc. The Branch is responsible for publishing provincial agricultural statistics and maintains an agriculture reference library.

The Co-operative Services Branch registers and supervises co-operatives and credit unions and administers the Acts governing them. It also collects and compiles statistics on co-operative activity throughout the province. Producer marketing boards and Marketing Commissions under the Natural Products Marketing Act are also served and administered through this Branch.

The Veterinary Services Branch provides a diagnostic laboratory for animal diseases; administers the Veterinary Services District Act and the Veterinary Science Scholarship Fund Act; and works in close co-operation with practising veterinarians and the federal Health of Animals Branch in the control of livestock and poultry diseases.

**Saskatchewan.**—The Saskatchewan Department of Agriculture is composed of the following branches and services.

The Agricultural Extension Branch is the main extension agency of the Department and has the primary objective of maintaining and increasing the over-all efficiency of agricultural production. To that end it provides a basic extension program designed to: (1) ensure that the most modern farming techniques and the latest research findings are made available to farmers; (2) provide leadership and general guidance in agricultural adjustment programs needed to bring about necessary social and economic progress; and (3) co-ordinate and administer field programs and policies sponsored by other branches for the purpose of encouraging desirable adjustments in agricultural production and to cope with emergency situations. The Branch endeavours to maintain close co-operation with other branches of the Department as well as with the University of Saskatchewan and the Canada Department of Agriculture in the three-way co-ordination of agencies known as the co-operative extension program.

The Production and Marketing Branch is comprised of three major Divisions—Animal Industry, Plant Industry and Veterinary. The first two provide specialist services to agricultural representatives and agriculture in field crops, weed and insect control, soil conservation, horticulture, apiculture, livestock and poultry, and administer related Acts and programs. The Veterinary Division administers the Veterinary Service District Act and Calfhood Vaccination Program, provides laboratory services and co-operates with the Federal Government and local veterinarians in disease prevention and control.

The Conservation and Development Branch provides engineering services for flood control and water use projects and for irrigation development. It is responsible for construction of works for the Saskatchewan River Irrigation Project and does much of the development work for the community pastures.

The Lands Branch administers Crown land, except forest reserves and parks in settled areas, classifies it according to the use for which it is best suited and disposes of it through lease or sale. The Branch also secures land control for land utilization projects, supervises new settlement projects, pays for clearing and breaking by farmers on provincial leases, operates provincial community pastures and operates training farms for people of Indian ancestry.

The Family Farm Improvement Branch gives farmers technical advice on farm buildings, farmstead planning, mechanization and materials handling. The Branch conducts research for farm water and sewage works, provides technical and financial assistance for their installation and administers the Agricultural Implements Act.

The Economics and Statistics Branch undertakes research and investigations required to formulate and evaluate policies and programs that will ensure a high level of growth and efficiency in Saskatchewan's agriculture; it collects, analyses and distributes economic information. The Farm Management Division carries out an extension program in farm business management. Data on crop conditions, production, marketings and income are available from the Statistics Division.

**Alberta.**—The Alberta Department of Agriculture has six Divisions whose activities are co-ordinated by an Executive Committee made up of the six Directors, the Deputy Minister and his executive assistant.

The Plant Industry Division administers programs and policies relating to crop improvement, crop protection and pest control, weeds, soils and fertilizers, horticulture, apiculture and special projects. It operates a crop clinic in Edmonton, a horticultural

research station at Brooks, and an extensive tree nursery at Oliver which supplies millions of trees yearly for farm planting and for reforestation.

The Animal Industry Division administers legislation, policies and programs in the broad area of livestock, dairy and poultry production and in processing and marketing. Included are: setting standards for and approving public sales of sires, ROP programs for beef cattle, swine and sheep, extension programs for all classes of stock, and administering standards and qualifications for the artificial insemination (AI) industry; supervising feeder associations; brand registration and inspection; licensing of butchers, livestock dealers, stockyards and AI technicians; pound districts and sale of horned cattle. The testing, grading and purchasing of raw produce by all dairy plants are under regulation, as are standards of construction, manufacture, processing, sanitation and temperature control for dairy and frozen-food plants. A regular cow-testing service to provide the basis for breeding, feeding and culling dairy cattle is available to dairy producers, and chemical and bacteriological analyses are conducted for industrial directives. Licences are issued to poultry hatcheries, wholesalers, first receivers and truckers, and programs are conducted for control of pullorum-typhoid diseases of chicken- and turkey-hatching egg supply flocks; extension programs, cost studies, disease tests and surveys, and research projects with respect to poultry are also carried out.

The Veterinary Services Division provides diagnoses of livestock and poultry diseases and conducts investigations of disease conditions; provides lecture service for the University of Alberta and for other groups; promotes policies aimed at reducing losses such as vibriosis and mastitis control, stockyard inspection and swine health programs; administers the licensing of live fur bearing animals and pelts; and assists fur farmers in care, management and stock improvement.

The Extension Section of the Extension and Colleges Division co-ordinates the extension programs of every Division of the Department of Agriculture. In association with other extension agencies, it assumes leadership in the formulation and implementation of District and regional programs for agriculture, family living and community development. The four Extension Branches operate mainly through 54 District Extension Offices co-ordinated by six regional Directors, and complemented by an expanding staff of regional specialists in livestock, plant industry, engineering and home economics. Leadership training is also provided. The Information Branch is in charge of extension through mass media. It distributes bulletins, pamphlets, building plans, releases, timely articles and news material to the press, conducts radio programs five days a week over 10 radio stations and takes an increasing part, both directly and indirectly in the production of television programs on all phases of agriculture and home-making.

Agricultural and vocational colleges are operated at Olds, Vermilion and Fairview, all three offering five courses in agriculture—a general course, or majors in plant science, animal science, agricultural mechanics and farm management. They also offer a complete business course. Special short courses offered at one or the other of the colleges include land appraisal and assessment, artificial insemination, welding and motor mechanics, irrigation technology, pesticide applicators, building materials merchandising, automation technology, dairy production and custodial housekeeping.

The Agricultural Economics Division provides extension information on farm management, credit and marketing to aid farmers in instituting good business practices on the farm; collects, analyses and disseminates agricultural statistics in collaboration with Statistics Canada; conducts studies on farm production costs and returns, marketing, and resource and rural development; and provides advisory assistance on economic matters to government departments, the agriculture industry and farm groups. Credit is made available to farmers for the purchase of land under the Farm Purchase Credit Act and for home improvements under the Farm Home Improvement Act.

The Program Development Division administers a number of programs that do not fit in with the work of other Divisions. Branches of the Division include the Agricultural Products Marketing Council, which establishes and regulates marketing boards and com-

missions to assist in the marketing of agricultural products; the Municipal Relations Branch, which assists in programs carried out by local authorities, administers the federal-provincial manpower agreements, and assists in the administration and achievement of objectives of agricultural societies; and the Irrigation Secretariat, which administers, for the Irrigation Council, the Alberta Irrigation Act in the areas of administration, operation, maintenance and reconstruction of irrigation projects and districts in the province.

**British Columbia.**—The Department of Agriculture comprises four Divisions—Administrative Services, Production Services, Special Services and General Services. Administrative Services is responsible for the direction of policies affecting farmers' institutes, grants, accounts, personnel and publications. Production Services includes the Apiary, Dairy, Field Crops, Horticulture, Livestock, Poultry, Farm Management and 4-H Club Branches, and district agriculturists. Special Services include the Animal Pathology, Engineering, Entomology, Markets and Statistics, Soils, Veterinary and Plant Pathology Branches. The remainder—Agricultural Rehabilitation and Development Act (ARDA), Information Service, British Columbia Marketing Board, British Columbia Milk Board, Crop Insurance Branch and Institutional Farms—are grouped under General Services.

In addition to the headquarters staff at Victoria, the Department maintains 19 district offices in various parts of the province, as well as a veterinary laboratory and poultry-testing station at Abbotsford, a beef-testing station at Kamloops and dairy and entomology laboratories at Vancouver and Cloverdale, respectively. Soil-testing facilities are installed at Kelowna.

### **Subsection 2.—Agricultural Schools, Colleges and Universities**

All of the provinces of Central and Western Canada have agricultural colleges in association with universities that give courses leading to degrees in agricultural science and home economics and also provide postgraduate courses; the University of British Columbia has a faculty of Agricultural Sciences; Ontario, Quebec and Saskatchewan have veterinary colleges. In addition, all of these provinces have schools of agriculture or diploma courses that provide basic training for young people intending to return to farms or interested in employment in businesses allied with agriculture.

In Alberta, these programs are offered at the vocational, technician and technologist levels by three agricultural and vocational colleges which also engage in applied agricultural research and offer programs in adult education and upgrading (see p. 549).

In Quebec, scientific education in agriculture is available at Laval and McGill Universities, and two institutes offer technical and technological courses in agriculture. Vocational education generally is the responsibility of the Department of Education.

In the Maritime Provinces, training in scientific agriculture is available at colleges in Prince Edward Island and Nova Scotia where courses leading to third-year admission to degree courses elsewhere are given. Vocational and short courses are available in all three provinces. All colleges of agriculture engage in research and extension activities.

## **Section 4.—Statistics of Agriculture\***

The collection, compilation and publication of statistics relating to agriculture is a responsibility of Statistics Canada. Valuable information is obtained through the Censuses of Canada, through partial-coverage mailed questionnaire surveys and from the administrative records of government operations.

Statistics Canada collects and publishes primary and secondary statistics of agriculture on an annual and monthly basis. The primary statistics relate mainly to the reporting of crop conditions, crop and livestock estimates, wages of farm labour and prices received by farmers for their products. The secondary statistics relate to farm income and expenditure,

\* Revised in the Agriculture Division, Statistics Canada.

per capita food consumption, marketing of grain and livestock, dairying, milling and sugar industries and cold storage holdings. In the collection of annual and monthly statistics, the Canada Department of Agriculture and various provincial departments, as well as such agencies as the Canadian Grain Commission and the Canadian Wheat Board, contribute statistical data to the bureau and aid directly in Statistics Canada survey work. Many thousands of farmers throughout Canada send in reports voluntarily and dealers and processors also provide much valuable data. The figures contained in this Section do not include estimates for Newfoundland; agriculture plays a relatively minor part in Newfoundland's economy and commercial production of most agricultural products is quite small. In the following Subsections, details are given for 1970 with earlier comparisons; figures for the latest year are subject to revision and it should be noted that many of those given for earlier years have been revised since the publication of the 1970-71 Year Book.

### Subsection 1.—Income from Farming Operations

**Cash Receipts from Farming Operations.**—Estimates of cash receipts from farming operations include data concerning cash receipts from the sale of farm products, Canadian Wheat Board participation payments on previous years' grain crops, net cash advances on farm-stored grains in Western Canada, deficiency payments made by the Agricultural Stabilization Board, and supplementary payments. Farm cash receipts from the sale of farm products include the returns from all sales of agricultural products except those associated with direct inter-farm transfers. The prices used to value all products sold are prices to farmers at the farm level; they include any subsidies, bonuses and premiums that can be attributed to specific products but do not include storage, transportation, processing and handling charges which are not actually received by farmers.

Total cash receipts from farming operations for 1970, excluding supplementary payments, are estimated at \$4,108,600,000 for Canada (excluding Newfoundland). This estimate is slightly below the value of \$4,182,100,000 in 1969 and 2.0 p.c. below the average for the five-year period 1965-69. This small decrease in cash receipts can be attributed for the most part to lower Canadian Wheat Board participation payments and increased repayments of cash advances on farm-stored grains in Western Canada being only partially offset by increased receipts from the sale of wheat, barley, oilseeds, potatoes and most livestock and livestock products.

The largest increases in total cash receipts in 1970 occurred in Prince Edward Island and New Brunswick which registered rises of 16.5 p.c. and 12.2 p.c., respectively, over 1969. In British Columbia the estimate for 1970 was 3.5 p.c. above that for the previous year and in Nova Scotia receipts were very similar for both years. The declines in all the other provinces ranged from 1.2 p.c. in Ontario to 4.6 p.c. in Alberta.

#### 7.—Cash Receipts from Farming Operations (excluding Supplementary Payments),<sup>1</sup> by Province, 1966-70

Province	1966	1967	1968	1969	1970
	\$'000	\$'000	\$'000	\$'000	\$'000
Prince Edward Island.....	37,016	33,830	34,476	37,555	43,740
Nova Scotia.....	54,074	54,182	55,026	63,348	63,456
New Brunswick.....	52,626	48,139	49,034	51,285	57,531
Quebec.....	589,845	620,120	636,814	672,333	662,252
Ontario.....	1,243,473	1,281,568	1,316,868	1,370,905	1,355,237
Manitoba.....	376,520	372,700	364,660	351,444	336,258
Saskatchewan.....	948,649	976,187	893,114	709,703	691,006
Alberta.....	762,950	792,901	799,939	727,471	694,062
British Columbia.....	188,026	196,785	204,615	198,057	205,039
<b>Totals.....</b>	<b>4,253,179</b>	<b>4,376,412</b>	<b>4,354,546</b>	<b>4,182,101</b>	<b>4,108,581</b>

<sup>1</sup> See text below.

In addition to the above income, farmers received supplementary payments amounting to \$58,200,000 during 1970 compared with \$9,900,000 in 1969. For both years, supple-

mentary payments included those made under the provisions of the Prairie Farm Assistance Act.\* They also included, in 1969, payments to sugar beet growers in Ontario and, in 1970, payments made under the Lower Inventory For Tomorrow (LIFT) program. When added together, cash receipts from farming operations and supplementary payments totalled \$4,166,800,000, slightly below the 1969 level of \$4,192,000,000.

**Field Crops.**—Total cash returns to farmers during 1970 from the sale of field crops, cash advanced on farm-stored grains in Western Canada and Canadian Wheat Board participation payments amounted to \$1,397,000,000, 5.1 p.c. below the 1969 level of \$1,472,100,000. These estimates of field crop receipts for 1970 represent 34.0 p.c. of farmers' total cash receipts from farming operations compared with 35.2 p.c. in 1969. The reduction in 1970 was attributable to a large decrease in net cash advances on farm-stored grains together with a decline in Canadian Wheat Board participation payments on previous years' wheat, oats and barley crops, being only partially offset by increased returns from all items within the total crops categories except oats and sugar beets.

During 1969, cash advances on farm-stored grains exceeded repayments by \$157,900,000; in 1970, repayments exceeded cash advances by \$105,400,000. Participation payments on previous years' grain crops fell from \$68,500,000 in 1969 to \$6,600,000 in 1970.

Although average initial prices for wheat in 1970 were below those prevailing during the previous year, marketings were considerably expanded and returns from this source rose by \$95,800,000 to a value of \$568,600,000. Average barley prices at time of delivery were also lower during 1970 but the much larger marketings resulted in returns to the farmers rising by 64.4 p.c. to \$145,800,000 in 1970. With both increased marketings and higher prices, the value of sales of rapeseed almost doubled, rising from \$51,600,000 to \$97,300,000, and the rise in returns to potato producers from \$66,300,000 to \$92,500,000 was almost all attributed to a considerable increase in prices received. Smaller increases in cash receipts were registered for rye, flaxseed, soybeans and corn and receipts for tobacco rose from \$144,900,000 to \$154,900,000.

**Livestock and Livestock Products.**—Total cash receipts to farmers from the sale of livestock and livestock products in 1970 amounted to \$2,624,300,000, 1 p.c. above the 1969 level of \$2,597,100,000. The largest increase occurred in the value of sales of pigs; although average prices during the year were below those of 1969, marketings were sufficiently higher to result in cash receipts from this source rising by 5.8 p.c. to an estimated \$488,000,000, compared with \$461,300,000 in 1969. Cash receipts from cattle were higher than those received in 1969 but receipts from calves were slightly below the 1969 level; prices were higher for both cattle and calves than in the previous year. Total returns from cattle and calves showed an increase of 1 p.c., rising from \$964,100,000 in 1969 to \$974,100,000 in 1970. For dairy products, slightly higher prices combined with a small decline in marketings to give a value of sales of \$677,200,000 almost unchanged from the 1969 value of \$677,000,000. However, supplementary dairy payments at \$66,600,000 declined by 23.4 p.c. from the 1969 value of \$86,900,000. Returns to poultry meat producers increased from \$249,600,000 in 1969 to \$258,900,000 in 1970 and for eggs, lower average prices more than offset increased marketings resulting in total receipts falling by 8.7 p.c. to \$172,100,000.

**Farm Net Income.**—Two different estimates of farm net income from farming operations are prepared by Statistics Canada. *Realized net income* is obtained by adding together farm cash receipts from farming operations, supplementary payments and the value of income in kind, and deducting farm operating expenses and depreciation charges. This estimate of farm net income represents the amount of income from farming that operators have left for family living, personal taxes and investment after provision has been made for operating expenses and depreciation charges. The second estimate is referred to as *total net income* and is obtained by adjusting realized net income to take into account changes occurring in inventories of livestock and stocks of field crops on farms between the beginning

\* Payments to farmers under the provisions of the Prairie Farm Assistance Act were made from the Prairie Farm Emergency Fund to which farmers contributed by means of a 1-p.c. levy on grain marketings (see p. 541).

### 8.—Cash Receipts from Farming Operations, by Commodity or Other Source, 1966-70

Item	1966	1967	1968	1969	1970

<sup>1</sup> See text on pp. 551-552.

and end of the year. This latter estimate is used in calculating the contribution of agriculture to National Income and for making comparisons with net income of non-farm business enterprises.

For 1970, the estimated realized net income of farm operators from farming operations amounted to \$1,190,600,000, 7.6 p.c. below the 1969 value of \$1,289,100,000 and 22.6 p.c. below the 1965-69 average of \$1,537,300,000. During 1970, slightly lower farm cash receipts and income in kind, and higher farm operating expenses were only partially offset by increased supplementary payments.

The 1970 estimate of total net income, which takes into account changes in the value of farm inventories of field crops and livestock, amounted to \$1,233,000,000, 21.7 p.c. below the 1969 level of \$1,575,000,000 and 25.5 p.c. below the 1965-69 average of \$1,656,100,000. As stated on p. 551, total cash receipts from farming operations for 1970, excluding supplementary payments, were estimated at \$4,108,600,000, slightly below the value of \$4,182,100,000 received in 1969 and 2.0 p.c. below the average for the period 1965-69. Supplementary payments amounted to \$58,200,000 during 1970 compared with \$9,900,000 in 1969.

During 1970, total operating expenses and depreciation charges reached a new high of \$3,493,500,000, 2.1 p.c. above the 1969 value of \$3,421,100,000. Outlays by farmers were higher in all provinces except Saskatchewan and Alberta and, for Canada as a whole, taxes,

gross farm rent, machinery repairs, fertilizer and lime, other livestock expenses and repairs to buildings all decreased. The most notable declines were those for taxes and for fertilizer and lime. The decline in taxes paid on owned land and buildings, from \$185,600,000 in 1969 to \$176,900,000 in 1970, was almost entirely due to lower payments in Ontario resulting from the farm tax reduction program that went into effect in that province; the reduction in outlays for fertilizer that occurred in the Prairie Provinces followed the use of smaller quantities purchased at somewhat lower prices. Gross farm rents were down by 8.1 p.c., the decrease resulting from lower values of cash and share rents in the Prairie Provinces; the decline in the share rent component was a direct consequence of the lower output of grains in the Prairie Provinces brought about by the LIFT program. Outlays for wages to farm labour reached a new high at slightly more than \$320,000,000 but, in the Prairie Provinces, a reduced hired farm labour force almost offset the higher rates being paid, so that expenditures for this item in 1970 were little different from those of 1969. Total machinery expenses increased by about \$15,000,000 to reach a new record of \$573,200,000; of the components included in this category, machinery repairs declined slightly. Higher feed prices in the eastern provinces combined with an increase in quantities purchased raised outlays from \$547,300,000 in 1969 to about \$589,600,000 in 1970. Expenses incurred in repairing buildings were lower than those made in 1969 and electricity and telephone costs showed little variation.

### 9.—Net Income of Farm Operators from Farming Operations, by Item and by Province, 1966-70

(Exclusive of Newfoundland)

NOTE.—Includes estimated rental value of farm homes, supplementary payments made under the provisions of the Prairie Farm Assistance Act and payments under the Western Grain Producers' Acreage Payment Regulations.

### Subsection 2.—Volume of Agricultural Production

The index of physical volume of agricultural production for Canada (1949=100) shows that, in 1970 compared with 1969, agricultural output declined in all provinces except Ontario and British Columbia. The largest decrease was in Saskatchewan where, as a result of the LIFT program, production of grains was sharply below that of the previous year.

In the Maritime Provinces, production dropped by about 2 p.c. in both Prince Edward Island and Nova Scotia and by 11 p.c. in New Brunswick. Although production of cattle, pigs, hens and chickens was higher in all three provinces, this did not offset lower output of potatoes in Prince Edward Island and New Brunswick and of eggs in Nova Scotia and New

Brunswick. Production in Quebec remained almost unchanged in 1970, increased output of livestock and poultry offsetting reduced dairy production. Output of dairy products in Ontario was slightly lower than in 1969 but increases in grains, potatoes, cattle, pigs and poultry brought the total up 3.3 p.c. In the three Prairie Provinces, the considerable decline in wheat production resulting from the LIFT program brought about a decline in production in Manitoba, Saskatchewan and Alberta of 5.7, 24.5 and 4.4 p.c., respectively; however, apart from a small decline in the output of potatoes in Manitoba and lower production of calves in all three provinces, most of the other items increased in 1970. Higher output of potatoes, cattle, pigs, poultry, dairy products, eggs and fruit in British Columbia more than offset a slight decline in grain production and provided an increase over the previous year of 5.4 p.c.

The index of physical volume of agricultural production is an index of unduplicated gross farm production; in its construction, provision has been made to avoid double-counting of farm output. Within a province, such double-counting could occur when feed grains, credited to field crop production, are fed to livestock and appear later as livestock and livestock products. Interprovincially, this duplication could occur when feed grains produced in one province are fed in another, and when feeder cattle raised in one section of the country are shipped to another for finishing.

#### 10.—Index Numbers of Physical Volume of Agricultural Production, by Province, 1961-70 (1949=100. Exclusive of Newfoundland)

NOTE.—For a description of the index, methods and coverage, see Statistics Canada publication *Index of Farm Production 1966* (Catalogue No. 21-203).

Year	P.E.I.	N.S.	N.B.	Que.	Ont.	Man.	Sask.	Alta.	B.C.	Total

#### Subsection 3.—Field Crops\*

The 1970 index of field crop production for Canada (1949=100) at 177.4 was below the 1969 level of 195.5 and much below the record 203.0 reached in 1966. Compared with 1969, decreases were recorded in the three Prairie Provinces. In Manitoba, the index was 137.6 compared with the record 132.0; in Saskatchewan, it was 204.5 against 257.7 in 1969; and in Alberta it was 223.4 compared with 237.2 in the previous year.

The 1970 field crop production indices for Central and Eastern Canada were close to the levels in 1969. The Ontario index reached a record 175.5 compared with the previous high of 167.1 in 1968; the Quebec index standing at 126.3 was below the 1969 index of 128.4 and the 1967 record of 132.0; and the index levels for Prince Edward Island, Nova Scotia and New Brunswick, with 1969 levels in brackets, were: 104.2 (115.3); 53.0 (55.7); and 82.8 (92.8), respectively.

Canada's 1970 wheat crop, estimated at 331,500,000 bu., was some 52 p.c. below the 1969 crop of 684,300,000 bu. The average yield per acre at 26.6 bu. was 3 p.c. less than the 1969 yield of 27.4 bu. but 25 p.c. above the 10-year (1959-68) average of 21.2 bu. The average protein content of the 1970 crop of hard red spring wheat was 13.2 p.c.; this level was significantly lower than the average value of 13.9 p.c. for the 1969 crop and also lower than the mean value of 13.6 p.c. for all new spring wheat crops during the 20-year period 1950-69.

\* The supply and disposition of the major Canadian grains is dealt with in Chapter XX, Pt. I, Sect. 2, under the heading of "The Grain Trade, 1969-70 and 1970-71".

Supplies of Canadian feed grains (corn, oats, barley, rye, mixed grains and buckwheat) in the crop year 1970-71 amounted to 1,377,100,000 bu., some 6 p.c. above the 1969-70 total of 1,299,300,000 bu. All feed grain production except oats contributed to the increase, as well as higher opening stocks of oats, barley and rye. Supplies of oats (Aug. 1, 1970 carryover of 141,300,000 bu. plus a crop of 367,800,000 bu.) totalled 509,200,000 bu., 2 p.c. higher than the previous year's total of 500,000,000 bu.; supplies of barley, at a record 615,800,000 bu. (carryover of 200,100,000 bu. plus a crop of 415,700,000 bu.), were 7 p.c. above the 1969-70 total of 577,800,000 bu.; supplies of rye at 33,100,000 bu. were 31 p.c. above the 1969-70 total of 25,200,000 bu.; and the 1970 crops of mixed grains reached an estimated 98,600,000 bu. The 1970 record production of grain corn, at 100,300,000 bu., was 37 p.c. larger than the 73,400,000 bu. of the previous year.

Acreages, yields and prices of the principal field crops in the three years 1968-70, with averages for 1963-67, are shown in Table 11; acreages, yields and values of field crops by province for 1969 and 1970, with averages for 1963-67, in Table 12; and acreages and production of grain in the Prairie Provinces for the years 1965-70 in Table 13.

**Stocks of Canadian Grain.**—Table 14 shows the stocks of Canadian grain on hand in Canada and in the United States on July 31 for the years 1967-70 with averages for the five-year periods 1957-61 and 1962-66. Stocks in Canada are separated into those in commercial positions and those on farms. Stocks on farms and in country elevators in the Prairie Provinces are given separately.

#### Subsection 4.—Livestock and Poultry

**Livestock.**—Of the total cash receipts from farming operations in 1970 of \$4,162,000,000, about 63 p.c. (\$2,624,000,000) came from the sale of livestock and animal products; this was a slightly higher proportion than in 1969. Sales of cattle and calves at \$974,000,000 and of pigs at \$488,000,000 in 1970 represented 23 p.c. and 11 p.c., respectively, of total cash receipts, proportions that also varied little from 1969. Receipts from the sale of sheep and lambs declined to about \$8,000,000 from \$9,000,000 in the previous year.

The number of cattle and calves on farms in Canada (exclusive of Newfoundland where there were 8,554 head at the time of the 1966 Census) at June 1, 1970 was estimated at 13,060,400, an increase of 4 p.c. over 12,586,000 at the same date of 1969. This was the first increase reported in cattle numbers since 1965 when there were 13,260,000 head on farms. The swing away from dairy animals toward beef continued in 1970. Milk cow numbers at 2,550,600 decreased by 1 p.c., continuing the downward trend begun in 1962, but beef cows at 3,082,100 increased by 5 p.c. and steers at 1,832,500 by 6 p.c. Inspected slaughter of cattle in 1970 amounted to 2,700,833 head, down 1 p.c. from 1969. More beef heifers were kept back for breeding in response to higher beef prices, thus reducing total slaughter. Exports of slaughter cattle (200 lb. or more) in 1970 amounted to 17,357, which was a 35-p.c. decrease from 1969. Exports of feeder cattle were down by 71 p.c. from 26,248 in 1969 to 7,507 in 1970 but calf exports to the United States at 117,427 head were 1.5 p.c. higher. However, there was an increase in both beef exports (68 p.c.) and beef imports (21 p.c.); imports from Australia doubled compared with 1969. Weighted average price for choice slaughter steers at Toronto in 1970 was reported to be \$32.25 per cwt. as against \$31.10 in 1969, and for good feeder steers \$33.95 compared with \$31.60 in 1969. These 1970 prices were well above the five-year (1965-69) averages of \$28.10 and \$27.85, respectively. All grades of cattle brought higher prices.

There were 7,086,000 pigs on farms in Canada (excluding Newfoundland where there were 7,307 at June 1, 1966) at June 1, 1970, 23 p.c. more than on June 1, 1969 and the highest number since 1943 when there were 7,413,100. The increase took place mainly in Western Canada where the number rose by 45 p.c. and where the farmers, because of the poor international wheat sales, marketed some of their grain through pigs. There were 8,648,250 pig carcasses graded in 1970, a 16-p.c. increase over 1969, but in the last quarter of the year the numbers slaughtered were 30 p.c. higher as the full impact of the increased production began to be felt. The increased slaughter caused prices to drop making the weighted average price per cwt. for an "Index 100" pig at Toronto \$32.20 compared with \$35.70 in 1969. The lower prices, however, boosted exports of both pork and live pigs. Exports of pork increased by 22 p.c. to 70,550,548 lb. and exports of live pigs increased by 341 p.c. to 61,272 in 1970. Most of the increased export movement of live pigs was from Western Canada to the northwestern United States.

The sheep and lamb population of Canada (excluding Newfoundland where there were 14,381 on June 1, 1966) showed its first increase since 1958, rising 2 p.c. from June 1, 1969 to 898,000 on June 1, 1970; an 8-p.c. increase in Western Canada more than offset a 5-p.c. decrease in the eastern provinces. The breeding flock of sheep (one year old and over) increased 2 p.c., rising 7 p.c. in the western provinces and dropping 1 p.c. in the east. The build-up in sheep numbers was one of the reasons for the sharp decline of 15 p.c. in the inspected slaughter of sheep and lambs from 212,751 in 1969 to 181,332 in 1970. As domestic demand increased, exports of sheep and lambs dropped by 57 p.c. from 22,466 in 1969 to 9,577 in 1970. Imports of live animals rose from 22,188 head to 28,121 head but imports of mutton and lamb went down by about 7 p.c. from 75,114,300 lb. to 70,010,600 lb. The weighted average price for good lambs at Toronto was \$33.65 in 1970 compared with \$32.80 in 1969 and \$28.45 for the 1965-69 average.

**Subsection 5.—Dairying**

The numbers of dairy cattle on farms have generally been declining gradually for many years; Quebec is the exception among the provinces in this respect, having increased its stock of milk cows by nearly 50,000 in the 1967-70 period. Despite the over-all decrease in numbers, the total milk production in Canada has been kept at a fairly static level by an increased output per cow. Production is concentrated in Central Canada, the Provinces of Quebec and Ontario accounting for about 73 p.c. of the total quantity.

<sup>1</sup> Used in farm butter only.  
purposes.

<sup>2</sup> Represents milk and cream, in milk equivalent, sold off farms for fluid

The farm value of milk production in Canada in 1970 was \$740,705,000, only slightly lower than in 1969; 63 p.c. of the total milk production was used in factories (\$364,814,000) and 29 p.c. was sold in fluid form (\$313,538,000). The 327,755,000 lb. of creamery butter produced during the year accounted for 42 p.c. of the milk output and was 6.4 p.c. lower than in 1969. Per capita consumption was 15.32 lb., slightly higher than in 1969. Quebec accounted for nearly half of the total output and Ontario followed with 28 p.c.

Both output and consumption of cheese have been gradually increasing during the past few years. The total production of factory cheese (Table 21) for 1970 was 212,377,000 lb. compared with 207,137,000 lb. for 1969, and per capita consumption of all varieties of cheese, excluding cottage cheese, was 11.72 lb., compared with 11.23 lb. for 1969. Exports of all cheese, mostly cheddar, amounted to 39,435,000 lb. in 1970 as against 35,958,000 lb. in 1969. Ontario accounted for 49 p.c. of the output and Quebec for 44 p.c.

There has been a generally decreasing trend in the production of concentrated whole milk products, which include condensed milk, evaporated milk, whole milk powder, partly skimmed evaporated milk and others. On the other hand, the general trend in the production of concentrated milk byproducts has been upward, although there was a small decrease in 1970. The latter category includes condensed skim milk, evaporated skim milk, skim milk powder, powdered buttermilk, whey powder, casein and other byproducts, but skim milk powder accounts for nearly 80 p.c. of the total production.

Well-fed Holsteins receiving "something special" from a farmhand on a farm in the Richelieu Valley, south of Montreal. The lush flat valley contains prime grazing land for hundreds of dairy cattle.

The estimated total consumption of fluid milk and cream, on a milk-equivalent basis, has been on a slowly downward trend for a number of years but there was some improvement in 1970, as shown in Table 24. A longer time-period indicates a slight decline in the per capita consumption of milk and cream.

<sup>1</sup> Includes Newfoundland for all manufactured dairy products.<sup>2</sup> Includes, in addition to the items listed, malted milk, cream powder, partly skimmed evaporated milk, whole milk powder of less than 26-p.e. fat, formula milks, evaporated milk of 2-p.e. fat, and concentrated liquid milk.<sup>3</sup> Includes, in addition to the items listed, condensed buttermilk, powdered buttermilk, sugar of milk, casein, powdered whey, special formula skim milk products, lactalbumin and concentrated liquid skim milk. Since the quantities used for human consumption and livestock feeding cannot be separated, per capita figures include both.<sup>4</sup> Includes ice cream mix in terms of milk.

### Subsection 6.—Fruits, Vegetables and Other Farm Products

**Fruits.**—Commercial fruit growing in Canada is confined almost exclusively to rather limited areas in the Provinces of Nova Scotia, New Brunswick, Quebec, Ontario and British Columbia. Nova Scotia production is centred mainly in the Annapolis Valley and New Brunswick production in the St. John River Valley and Westmorland County. In Quebec the fruit growing districts are the Montreal area, the North Shore area, the Eastern Townships and the Quebec City district. Ontario fruit is grown in all the counties adjacent to the St. Lawrence River and the Great Lakes as far west as Georgian Bay, the Niagara district being the most productive. In British Columbia the four well-defined fruit areas are the Okanagan Valley, the Fraser Valley, the Kootenay and Arrow Lakes district and Vancouver Island. The climate elsewhere in Canada is not generally suitable for commercial tree-fruit culture. Apples and small fruits are produced commercially in the provinces named but tender tree fruits and commercial vineyards are largely limited to Ontario and British Columbia.

By far the most valuable fruit crop produced in Canada is apples and in 1969 the farm value for this crop was \$31,521,000. The main outlet for Canadian apples is the fresh market which absorbs about 67 p.c. of the production each year and the volume of apples for processing is about 33 p.c. of production. In Nova Scotia nearly 67 p.c. of the crop is processed; lesser quantities are processed in other producing provinces.

Strawberries are grown commercially in all provinces for which tree-fruit statistics are prepared, as well as in Prince Edward Island, but are produced over a somewhat wider area than are tree fruits. Raspberries are grown commercially in Nova Scotia, New Brunswick and Quebec but the bulk of the crop is produced in Ontario and British Columbia. The Fraser Valley of British Columbia is the most important producing area. Wild blueberries are harvested on a commercial scale in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick and Quebec. This crop is indigenous to certain areas in these provinces and a large percentage of the crop is frozen and exported. There is also some production of cultivated blueberries, particularly in British Columbia.

A marketing system has been developed for distributing fresh fruit from the specialized production areas to all parts of the country and a large proportion of the deciduous fruit consumed in Canada is grown domestically. Considerable quantities of apples, strawberries and blueberries are exported. Canning and processing industries have developed in the fruit growing districts and, although the importance of the processing market varies with different fruits, it provides a valuable outlet for substantial proportions of most Canadian-grown fruit crops.

Tables 26 and 27 show the estimated commercial production of fruit, by province and by kind, for 1968-70.

#### 26.—Value of Commercial Fruit Produced, by Province, 1968-70, with Average for 1963-67

**Vegetables.**—Estimates of acreage and production of commercial vegetables in Canada are prepared for all provinces except Newfoundland and Saskatchewan. Ontario is the largest producer, followed by Quebec and British Columbia. A wide variety of crops is grown in these three provinces and a somewhat smaller range in the Maritimes and in the Prairie Provinces.

Canning, freezing and processing of vegetables are carried on in the important producing areas. The estimates in the following tables cover output of commercial growers for processing and for sale on the fresh market but do not include averages or production of vegetables grown for home use on farms and elsewhere.

**Tobacco.**—Canada produces several types of leaf tobacco but by far the most important is the flue-cured or Bright Virginia type. This is grown mainly in Ontario, along with considerable quantities of burley and smaller amounts of dark (air-cured and fire-cured) tobacco. Quebec produces smaller quantities of these types as well as some cigar and pipe tobacco and small flue-cured acreages are also harvested in Prince Edward Island, Nova Scotia and New Brunswick. Acreages planted were lower in 1970 than in 1969 and, although yields per acre in all producing areas were higher, there was a drop in total production from 247,465,000 lb. in 1969 to 221,863,000 lb. in 1970. The average value per pound was 65.8 cents in 1969 and 64.4 cents in 1970.

No information is available on the production of cigarettes for domestic consumption but, on the basis of domestic sales reported to Statistics Canada by manufacturers, the number of cigarettes sold rose from 46,270,233,000 in 1968 to 46,582,210,000 in 1969 and 49,822,534,000 in 1970.

A fully automated tomato "factory" in southern Ontario in which two full crops totalling perhaps 500,000 lb. are harvested in a year. The electronically controlled glass house covers two and a half acres.

**31.—Acreage, Production and Value of the Commercial Crop of Leaf Tobacco, by Main Type, 1968-70**

<sup>1</sup> Includes other types not specified.

**Eggs.**—Egg production in 1970 at 495,650,000 doz. was 5.2 p.c. higher than in 1969 and 10.6 p.c. higher than the record 448,200,000 doz. produced in 1959. The number of layers increased slightly in 1970 over 1969, the rate of lay per 100 layers rose to 20,888

from 20,602 and the farm selling price of eggs averaged 35.4 cents per doz. compared with 41.5 cents. The Atlantic Provinces produced 8.2 p.c. of all eggs in 1970; Quebec, 15.9 p.c.; Ontario, 37.9 p.c.; the Prairie Provinces, 26.2 p.c.; and British Columbia, 11.8 p.c.

### 32.—Production, Utilization and Value of Farm Eggs, by Province, 1969 and 1970

<sup>1</sup> Total laid less loss.

**Wool.**—Table 33 gives the estimated production and apparent consumption of wool in Canada for the years 1967 to 1970. These estimates are not strictly comparable with those of previous years because they exclude the output of pulled wool which is now produced by fewer than three firms and, according to the provisions of the Statistics Act, cannot be shown. Canada produces only between 7 p.c. and 8 p.c. of domestic wool requirements.

### 33.—Production and Apparent Consumption of Wool, 1967-70

Item	1967	1968	1969	1970
Shorn Wool Produced—				
Yield per fleece..... lb.	7.6	7.5	7.6	7.7

Total value..... \$'000	1,952	1,663	1,590	1,079
Totals, Wool Production..... '000 lb.	3,758	3,476	3,465	3,458
Apparent wool consumption <sup>2</sup> ..... '000 lb.	55,586	60,985	54,228	43,758

<sup>1</sup> Includes Agricultural Stabilization Act payments of 27.9 cents per lb. in 1967, 29.4 cents per lb. in 1968, 29.0 cents per lb. in 1969, and 17.3 cents per lb. on the 1970 clip for qualifying grades of wool.

<sup>2</sup> See text above.

**Honey.**—As shown in Table 34, honey production in 1970 was considerably below that in 1969. Although the average production per colony was little changed, the number of beekeepers and the number of bee colonies were both lower. Honey is produced commer-

cially in all provinces except Newfoundland and yields vary to some extent from year to year. Alberta is consistently the largest producer, accounting for almost 40 p.c. of the total output in 1970. Honey bees are kept in some fruit growing districts for pollination purposes and are also used for pollination of certain seed crops. To facilitate storage, shipment and uniformity of quality, large quantities of Canadian honey are pasteurized. Beekeepers' marketing co-operatives are active in several provinces. In 1970, Canada exported 9,009,046 lb. of honey valued at \$1,867,000, almost twice the quantity exported in 1969. Exports went mainly to Britain, the United States, West Germany, Japan and the Netherlands.

### 34.—Honey and Beeswax Production 1968-70, with Average for 1963-67

Item	Average 1963-67	1968	1969	1970

**Sugar Beets and Beet Sugar.**—Sugar beets are grown commercially in Quebec, Ontario, Manitoba and Alberta and beet sugar factories are located in these provinces. In Quebec, commercial production is centred in the St. Hilaire area of the Eastern Townships; in Ontario, production is confined to the southwestern section of the province. Alberta produces the largest crop and in that province sugar beets are grown under irrigation.

**36.—Acreage, Yield and Value of Sugar Beets and Quantity and Value of Beet Sugar Shipments, 1964-70**

Year	Sugar Beets					Beet Sugar (All Types)

1970.....	68,771	13.33	916,906	10.70	9,811	253,161	23,320

**Maple Sugar and Maple Syrup.**—Maple syrup is produced commercially in the Provinces of Nova Scotia, New Brunswick, Quebec and Ontario. The bulk of the crop comes from the Eastern Townships of Quebec, a district famous both in Canada and in the United States as the centre of the maple products industry. Virtually all of the maple products exported go to the United States with the larger proportion moving as sugar, although substantial quantities of syrup are also shipped. Much of the syrup sold in Canada is marketed in one-gallon cans direct to the consumer from the producer but a considerable amount of both sugar and syrup is sold each year to processing firms.

**37.—Production of Maple Sugar and Maple Syrup, by Province, 1968-70, with Average for 1963-67**

**Greenhouse Operations.**—Annual surveys are made of greenhouse operations. Resulting figures are based on data reported by firms and individuals returning questionnaires, with the exception of that for cucumbers and tomatoes grown in Essex County of Ontario (the most important producing area), which are based on information obtained from the local co-operative marketing agency. Only greenhouses used for the production of items for sale are included in the survey.

### Subsection 7.—Prices of Agricultural Products

The monthly index of farm prices of agricultural products was designed to measure changes occurring in the average prices farmers receive at the farm from the sale of farm products. In comparing current index numbers with those prior to August 1970, the following points should be considered. Prices of all western grains used in the construction of the index prior to that date are final prices; all later figures are initial prices only for wheat, oats and barley. Any subsequent participation payments will be added to the prices currently used and the index revised upward accordingly.

### 39.—Average Index Numbers of Farm Prices of Agricultural Products, by Province, 1963-70, and Monthly Indexes for 1969 and 1970

(1961=100)

NOTE.—A description of this index, its coverage and the methods used will be found in Statistics Canada *Quarterly Bulletin of Agricultural Statistics* (Catalogue No. 21-003) for July–September 1969.

## Subsection 8.—Food Consumption

Food consumption figures represent available supplies, including production and imports, adjusted for change of stocks, exports, marketing losses and industrial uses. All calculations are made at the retail stage of distribution, except for meats for which the figures are worked out at the wholesale stage. The amount of food actually eaten would be somewhat lower than indicated because of losses and waste occurring after the products reach the hands of the consumer.

All basic foods are classified under 13 main commodity groups. The total for each group is computed using a common denominator for the group, for example: milk solids (dry weight) for the dairy products group; fat content for fats and oils; and fresh equivalent for fruits. All foods are included in their basic form, that is, as flour, fat, sugar, etc., rather than in more highly manufactured forms.

The series in Table 42 represents the official estimates of yearly supplies of food moving into consumption, expressed in pounds per capita, for the years 1964-68 as an average for comparison with the years 1969 and 1970.

**42.—Per Capita Supplies of Food Moving into Consumption 1969 and 1970, with Average for 1964-68**

<sup>1</sup> Quantity small; included with beef.      <sup>2</sup> Trimmed of larding fat and excluding offal.      <sup>3</sup> Includes commercial lard production and estimated lard equivalent of renderable pork fat available from all uninspected slaughter.      <sup>4</sup> Due to changes in lard source data, comparable information is not available.

## Section 5.—Agricultural Statistics of the Census

A summary of the agricultural statistics recorded by the Census of Canada is normally presented in this Section. Such summary data resulting from the 1971 Census as are available at the time of going to press with this publication (March 1972) will be found in Appendix II. A complete list of Census publications, with their prices and an order form, is available from Statistics Canada on request. It is expected that all reports in the Advance Series will be released by the end of 1972, and that the provincial reports in the Volume Series will be released by mid-1973.

### Publications of the 1971 Census of Agriculture

#### Advance Series

Reports in this Series provide published data at earlier dates than the regular series of volume reports and include data relating to the following: areas of field crops; numbers of livestock and poultry on farms; farm machinery and equipment; areas of vegetables, fruits, greenhouses and nurseries; area and use of farm land; a classification of farms by size, economic class and product type; use of fertilizer and irrigation on farms.

#### Volume Series

Reports in this Series represent the main results of the 1971 Census of Agriculture and may be ordered as separate provincial reports or in volume sets. These provincial reports are prepared in such a way that they may be combined within a hard-covered binder (provided with the set) to form the complete subject matter of each volume.

#### VOLUME IV (PART 1)—CENSUS OF AGRICULTURE

Includes reports showing complete provincial data for Newfoundland, Prince Edward Island, Nova Scotia and New Brunswick as well as a Canada summary.

#### VOLUME IV (PART 2)—CENSUS OF AGRICULTURE

Includes reports showing complete provincial data for Quebec and Ontario.

#### VOLUME IV (PART 3)—CENSUS OF AGRICULTURE

Includes reports showing complete provincial data for Manitoba, Saskatchewan, Alberta and British Columbia.

## Section 6.—International Crop Statistics

Tables 44 and 45 are based on estimates published by the Foreign Agricultural Service, United States Department of Agriculture, and give the acreages and production of wheat and the production of oats and barley for the harvests of 1969 and 1970 with average for the years 1964-68, in the leading countries of the world.

## 44.—Estimated Acreages and Production of Wheat Harvested in 1969 and 1970 in Specified Countries, with Average for 1964-68

NOTE.—Years shown refer to years of harvest in the Northern Hemisphere. Harvests of Northern Hemisphere countries are combined with those of the Southern Hemisphere which immediately follow.

### Section 1.—Canada's Mineral Industry\*

The Canadian mineral industry achieved impressive growth in output and sales in 1970. The pause in apparent growth of the industry in 1969 when strikes reduced possible output was fully corrected and new expansion records were set.† The annual rate of growth of the industry between 1968 and 1970 averaged close to 11 p.c., measured by value of shipments. This was achieved in a context of hesitation in growth of other sectors of the Canadian economy and in the face of slow-down of United States economic and mineral-imports growth. Also, the revaluation of the Canadian dollar at the end of May 1970 might have reduced export earnings for some commodities.

Canada's mineral production in 1970 was valued at \$5,769,000,000 (preliminary), compared with \$4,738,000,000 in 1969 and \$4,722,000,000 in 1968. Physical volume contributed strongly to the two-year increase with average annual increase in mine output at about 6.3 p.c. and average annual increase in volume of processing at close to 4 p.c. Some shift of output-volume balance toward more expensive commodities and some unit price increases accounted for the remainder of the rise in output value.

Canada produces about 60 different minerals from domestic deposits. The ten leading minerals comprised 81.8 p.c. of total output by value in 1970 compared with 79.1 p.c. in 1969 and 78.7 p.c. in 1968. The 1970 value for the ten leaders totalled \$4,720,000,000 with individual values at: petroleum, \$1,126,999,000; nickel, \$829,643,800; copper, \$782,490,300; iron ore, \$589,126,000; zinc, \$385,919,600; natural gas, \$350,953,000; asbestos, \$215,270,000; cement, \$160,440,000; natural gas byproducts, \$159,583,000; and lead \$121,246,900. The first four made up 57.7 p.c. of all mineral output value in 1970, whereas in 1960 they comprised 45.4 p.c. and in 1950, 32.7 p.c.

Canada produces nearly all the minerals needed for modern economies. Only a few items such as manganese, chromium, bauxite and tin are imported from lower-cost sources.

\* Prepared by D. S. Brearton and staff of the Mineral Resources Branch, Department of Energy, Mines and Resources, Ottawa.

† Because 1969 output was reduced through labour disputes, comparison of 1970 output with that of 1969 has little relevance. In much of this text 1970 is compared with 1968.

### VALUE OF MINERAL PRODUCTION\* AND ITS PERCENTAGE OF THE GROSS NATIONAL PRODUCT, 1935-70

Canada is the world's largest producer of asbestos, nickel, zinc and silver, is second in potash, molybdenum, gypsum, uranium and sulphur, and is among the leaders in production of titanium concentrates, platinum, aluminum, gold, copper and iron ore.

The great size of Canada's mineral industry is based largely upon export sales. Apparent domestic minerals consumption is equivalent to proportions of mineral output ranging from 6 p.c. for potash and nickel to about 20 p.c. for iron ore and about 43 p.c. for copper. The value of minerals and fabricated minerals exported in 1970 was 90 p.c. of mineral production value.

Exports of minerals and fabricated mineral products have led several great and sustained booms in the Canadian economy in the past and they have been a major factor in the surge in recent Canadian export trade. In 1970, these exports were valued at \$5,200,000,000 or 30.9 p.c. of the \$16,840,000,000 total of merchandise exports. This proportion is typical of the past decade or so, but it has been maintained despite the sudden and very large addition to Canada's automobile trade with the United States in the late 1960s. The level of mineral exports was greater in 1970 than in any earlier year despite weakening of United States demand. Shipments to the European Economic Community (EEC), Britain and Japan were significantly greater than formerly. Proportions shipped in 1970 to different markets (with dollar values in brackets) were: United States, 55 p.c. (\$2,860,000,000); Britain, 13.9 p.c. (\$720,000,000); Japan, 7.7 p.c. (\$400,000,000); and EEC, 10.8 p.c. (\$560,000,000). The proportion to the United States had been 60 p.c. in the previous two years; Britain's share was 13.3 p.c. in 1968, Japan's share 7.2 p.c. and the EEC's share 8.1 p.c. Japan's buying from Canada increased 25 p.c. over the two years 1968-70 and the EEC's 67 p.c.

In 1970, the classes of products contributing to total production of minerals and mineral products had the following shares (1968 shares in brackets) by value: fuels 29.8 p.c. (28.4 p.c.); metallics 54.0 p.c. (52.7 p.c.); non-metallics 8.6 p.c. (9.5 p.c.); and structural materials 7.6 p.c. (9.4 p.c.). The slight shift in significance of the classes reflects the relative stability

of the demand for domestic structural materials, the continued easing of prices in some non-metallics and the strong growth in exports of fuels and metallics. Contributions to 1970 value of minerals exports classified without aggregation of structural materials (which are minor items in exports) were fuels, fuel materials and products 18.6 p.c. (16.4 p.c. in 1968); metallic materials and products 70.8 p.c. (71.7 p.c. in 1968); and non-metallic materials and products 10.6 p.c. (11.9 p.c. in 1968).

<sup>1</sup> Value of Newfoundland production included from 1950.

Canada leads the world in mineral exports, and follows only the United States and the Soviet Union in production of minerals. This sector has always been most important in Canada's economic development and still is the main force in the northward advance of Canada's frontiers of population and economic activity.

Prices paid for minerals and metals presented a mixed picture in 1970. For copper and nickel, which bulk so large in Canada's exports, the prices paid were historically high but copper may have peaked out by the year-end. In the United States, copper brought 60 cents a pound early in the year but declined in the late months to 53 cents. In Canada, the course was 59 cents to 54 cents in the year.

Nickel prices in 1970 were stable in Canada but rose 5 cents in the United States to 133 cents, partially compensating Canadian producers for revaluation losses of revenue from export markets. Iron ore prices rose somewhat for both Lake Erie base-price deliveries and new long-term contracts. The good short-term prospect for the steel industry was reflected in higher prices for manganese, molybdenum, chromite, columbium, titanium and vanadium but tungsten prices fell. Aluminum in Canada was stable at 29.5 cents but rose 1 cent to 29 cents in the United States. Zinc, lead and silver prices declined significantly; zinc declined  $\frac{1}{2}$  cent to 15 cents in August, lead showed a slow decline from 16 $\frac{1}{2}$  cents to 14 $\frac{1}{2}$  cents, and silver prices dropped to \$1.609 by the year-end. Among non-metallics, asbestos was up 3 p.c. in January and then remained stable to the year-end. Sulphur and potash remained at low levels.

The great size of Canada's mineral industry rests upon a handful of minerals among the many produced. Petroleum (with natural gas), nickel, copper, iron ore and zinc together contribute three quarters of the total Canadian mineral output value and their significance calls for some discussion of their scale of operations, production locations, markets, new sources and prospects.

*Granisle mine on Babine Lake in northern British Columbia, one of that province's newer copper mines. The capacity of the concentrator, which was 6,500 tons of ore a day in 1971, is being expanded to 14,000 tons by late 1972. The copper concentrates are shipped to Japan for smelting.*

Petroleum, comprising crude oil and natural gas production and refining, is Canada's largest mineral industry. Domestic production and exports are small in the context of the world's industry but are of very great importance to Canada. This industry's growth in the past two decades has had important effects as a factor in the balance of payments, as a source of revenue to the several levels of government, and as a large component of engineering-construction activity.

In 1970, total petroleum (crude oil plus gas plus byproducts) production was valued at \$1,640,000,000, up 15.5 p.c. from \$1,420,000,000 in 1969. Crude oil production is concentrated in Alberta, with Saskatchewan a junior partner and only minor production elsewhere. The pattern of crude oil distribution in Canada reflects the National Oil Policy which is designed with several factors in mind: Canada's present producing fields are in mid-continent, and transport costs to eastern industry are quite significant, but the industry is not as low-cost a producer as is Venezuela or the Middle East. The Oil Policy therefore allocates markets west of the Ottawa Valley to Canada's mid-continent producers, and Quebec and Maritime markets are supplied by overseas oil. The mid-continent producers have an export market in mid-continent United States which in 1970 almost equalled in volume Canada's imports in the east. Thus, Canada produces oil almost equivalent to the total domestic needs but achieves in domestic markets the lowest-cost supply compatible with balance-of-payments aims. While the Alberta oilfields are producing much below capacity, the region's economic reserves of oil will last perhaps 20 years at current depletion rates. Canada's North is the focus of much optimism for large-scale oil finds, and exploration continues there.

Natural gas is an important domestic product and a valuable and growing export. Broadly speaking, gas is where oil is, that is, mainly in the western provinces and in Canada's Arctic. Natural gas production and sales are reported often in volume terms (thousands of standard cubic feet—Mcf.) but to compare, for example, oil and gas output, it is better to report equivalent thermal value, or values in dollars which do tend to reflect thermal values. In dollar terms, then, the gas and gas byproducts production of Canada in 1970 was \$510,000,000, compared with oil output of \$1,130,000,000; gas value was thus about 45 p.c. of oil value in the year, while in 1969, gas value was \$400,000,000 and oil value \$1,010,000,000 so that gas value was then close to 40 p.c. of oil. The upward shift of this ratio may continue; for both products, current scale and future growth depend significantly upon access to the United States market. In the case of gas, United States import policy seems focused on prices paid rather than on quantities imported, reflecting the special scarcity of gas reserves and supplies within that country.

Canadian reserves of gas are great. Western reserves are adequate for about 25 years at Canadian 1970 gross-production rate, and the economics of arctic transport are at present definitely more favourable for gas than for oil, so that the known Arctic gas reservoirs of giant size can perhaps be viewed with confidence as economically valid reserves. Production in Canada is increasing rapidly with growth of domestic and export markets. Domestic sales volume was 8 p.c. above 1969, and comprised 55 p.c. of the 1970 net domestic supply; exports, all to the United States, were 15 p.c. above 1969.

Concerning gas volumes data, the sources give, among other information, gross new production volume, net withdrawals volume, net domestic supply, and total demand. The first is new gas obtained from wells and in 1970 was 2,630,000 thousand standard cubic feet (Mcf.); the second was 2,280,000 Mcf. after waste, flaring and reinjection deductions; the third was 1,990,000 Mcf. after process shrinkage and storage-reservoir inventory adjustments and, because imports are now insignificant, this net domestic supply is effectively equivalent to total domestic supply and total domestic demand. Domestic sales plus exports fall short of total or net domestic supply by an amount that constitutes change in gas in process, change in pipeline inventory, etc. In 1970, the sum of domestic sales and exports was 1,700,000 Mcf., 12 p.c. above the 1969 amount. This marketable-production total of 1,700,000 Mcf. is much less than the 2,630,000 Mcf. gross production volume. Imports of gas in 1970 were insignificant—the pipeline systems from western to eastern provinces now have ample capacity following the major additions in recent years.

Nickel was in second place among Canadian minerals produced in 1970. Because Canada is the largest world producer, the labour troubles of 1969 in its nickel centres were a major influence on world nickel prices, which ended 1970 at a level one third higher than in 1968. This higher unit price, along with greater mine output, brought the value of nickel production in 1970 to \$830,000,000. Canada's output capacity for nickel should continue to increase; in the Sudbury basin two large mines opened during 1970, two others are being prepared there, and several others are firm producing prospects. In addition, larger output capacity is certain in Manitoba, and additions are possible in Quebec.

Copper was third by value of output among the minerals in 1970. Historically high price and increased production resulted in a record output value: tonnage produced amounted to 674,000, and capacity is expected to be 770,000 tons in 1971. World scarcity of copper seems to be ended for a while and official marketing controls were removed in Canada in September. Copper is produced in every province and territory except Prince Edward Island; Ontario dominates output, Quebec and British Columbia together equal Ontario and others are much less significant.

Iron ore production in 1970 was stimulated by demand from western Europe and by record domestic requirements which permitted peak production and shipments valued at \$590,000,000. Of the 38,700,000 long tons exported, the United States took 23,800,000 (26,700,000 tons in 1968), Britain took 4,900,000, western Europe 7,800,000 long tons and Japan 2,200,000, the latter being slightly more than West Germany and 1,000,000 less than the Netherlands. Canada's iron ore industry seems to have a strong future; immediate plans for expansion include new large-scale mines and new and enlarged processing facilities. Present Canadian capacity is 46,500,000 long tons mine output with 24,800,000 long tons pelletizing capacity. There are four producing provinces—Newfoundland (Labrador), Quebec, Ontario and British Columbia; Newfoundland (Labrador) dominates and British Columbia is minor.

Value of zinc production in 1970 was a record at \$385,920,000 but production (all forms) of zinc at 1,210,000 tons was only 10 p.c. above three-year-ago levels, reflecting the recent slowing of growth of markets. New mines are being prepared for production and Canada should continue as the world's largest producer of zinc.

The value of production of mineral fuels—coal, natural gas, natural gas byproducts and crude petroleum—rose to \$1,720,000,000 in 1970. A helpful change has occurred in the fortunes of the domestic coal industry; application of improved transport and mining techniques has revived the western coal industry and improved prices are giving a little help to eastern producers. Both output and revenues increased nationally but growth was wholly in the west. National output in 1970 was 16,000,000 tons (10,700,000 in 1969) with a value of \$80,500,000 (\$50,600,000 in 1969). Eastern output was only three quarters of the 1969 output; the west had a four fifths increase over 1969 production. Canada is a net importer of coal; 1970 exports were 4,100,000 tons but imports totalled 18,600,000 tons. Exports should reach more than 15,000,000 tons by 1972 under present contracts, mainly with Japanese iron-and-steel mills, and a balance in external trade in coal may be in sight.

## 2.—Value of Mineral Production, by Class, 1961-70

Year	Metallics	Non-metallics	Fuels	Structural Materials	Total
	\$	\$	\$	\$	\$

1970 <sup>p</sup> .....	3,115,462,400	498,449,800	1,718,041,000	436,768,000	5,768,721,200

The volume of mineral production index, which measures the mining industry's absolute growth (1961=100), increased 15.9 p.c. in 1970 to 174.8 from 150.8 in 1969; the 1960-70 average annual rate of growth was 5.8 p.c. In comparison, the volume index of total industrial production increased 2.1 p.c. to 172.3 from 168.7 in 1969 and the average annual rate of growth in the period 1960-70 was 6.5 p.c.

## 3.—Quantity Indexes of Production of the Principal Mining Industries, 1960-70

(1961=100)

Investment in new installations, equipment and machinery in Canadian mines, quarries and oil wells (including pipelines) was \$1,230,000,000 in 1970 compared with \$1,180,000,000 in 1969 and \$1,070,000,000 in 1968. The forecast for 1971 was \$1,560,000,000. Although new capital investment can fluctuate greatly from year to year, repair expenditures—a further \$43,000,000 on the 1970 new-capital value—usually rise fairly steadily over time.

The aggregate investment boom for the mining sector in the years since 1965 and the expected 1971 acceleration conceal declines of new investment in some activities and differences in experience in different regions of Canada. In metal-mining, the new-capital investment was below \$200,000,000 a year until 1965 but exceeded \$400,000,000 in 1970. Iron mines investment was relatively limited in 1969 and 1970 but other metal-mining investment, particularly for nickel and copper, was very high. New capital investment in non-metal mining (excluding oil and gas) was less than \$100,000,000 a year up to 1965 but an investment boom in asbestos, potash and coal brought the annual spending up to \$240,000,000 in both 1968 and 1969. Reported 1970 and forecast 1971 spending was in the \$170,000,000 range.

New capital investment in the petroleum and gas industry (mineral fuels excluding coal) climbed fairly steadily from the \$200,000,000-to-\$300,000,000-a-year rate of the early 1960s to \$542,000,000 in 1969 and \$620,000,000 in 1970; the 1971 forecast was \$700,000,000. Within this aggregate there was a shift in emphasis; recently, the spending on exploration and on development items has been stagnant but additions to feed and distribution systems for oil have been substantial. Gas production and processing investment was heavy in 1969 and in 1970.

The minerals (not oil or gas) investment in individual provinces reflects the regional concentration of mineral resources and, strongly, the medium-term market prospects of the resources. In the Maritime Provinces, absolute values of investment are small and spending patterns are not sharply clear and in Newfoundland (Labrador) iron mine investment is again heavy after a lull. In Quebec, investment is at moderate levels, with asbestos and iron ore expansions; through the 1960s, Quebec mining investment was hesitant but iron ore mining and processing spending promises to be large in the immediate future. In Ontario, the investment boom that began in 1965 is still accelerating; iron ore, copper-zinc and nickel-copper spending booms have succeeded one another. In the Prairie Provinces, investment has passed through sharply defined phases in the recent past, and at present is depressed. In sharp contrast is British Columbia where the value of mining construction (surface and underground) in 1970 comprised one third of the national total. Coal, particularly, and metals and asbestos expansions account for the fact that British Columbia mining construction has exceeded even that of Ontario in 1968, 1969 and 1970.

## Provincial and Territorial Mineral Production in 1970

The national output value of minerals is dominated by Ontario and Alberta. The great importance of nickel and of oil gave these producers about 52 p.c. of the total value of minerals output in both 1968 and 1970; Ontario produced 28.3 p.c. of the total in 1970 as against 28.7 p.c. in 1968. The contribution of Quebec in 1970 was 13.8 p.c. and of British Columbia 8.6 p.c.; Saskatchewan, Newfoundland and Labrador, and Manitoba were in the 7-to-5-p.c. range and the contribution of each of the three Maritime Provinces and the two Territories was less than 4 p.c. In 1970, Alberta produced 77 p.c. of the national fuels value, Ontario 45 p.c. of the national metallics value, and Quebec 43 p.c. of the national non-metallics value.

**Newfoundland (including Labrador).**—Mineral production value in Newfoundland (including Labrador) in 1970 was \$358,000,000 compared with a 1968 value of \$310,000,000, an increase of 15.5 p.c. In 1970, iron ore output reached 24,900,000 tons compared with 19,700,000 tons two years earlier; copper output was 15,400 tons, down from 23,300 tons partly because one mine closed in 1969 leaving four mines in operation; asbestos output was 66,000 tons against 69,000 tons; and the value of fluorspar production increased to \$4,200,000 from \$2,600,000.

**Prince Edward Island.**—Mineral output in this province is confined to structural materials, mainly sand and gravel, which in 1970 was valued at about \$500,000.

**Nova Scotia.**—Total mineral production value in 1970 in Nova Scotia was \$59,000,000, a level similar to those of 1969 and 1968 but below the levels of the mid-1960s. Coal output declined further in 1970 to 2,100,000 tons from 3,100,000 tons in 1968; although one new coal

mine was being prepared for operation at Lingan, the decline in this industry has been fairly rapid and would be more rapid without government intervention. Non-metallic mineral output, apart from coal, was valued at \$19,300,000, a substantial increase over the 1969 value of \$15,400,000. Output of metallica—lead and silver—fell off sharply from 1968 levels.

**New Brunswick.**—Mineral production value in New Brunswick in 1970 amounted to \$101,000,000 compared with \$94,000,000 in 1969 and \$88,000,000 in 1968. Close to 90 p.c. of this production was of metallic ores and products, the strength of which more than compensated for the continued decline in coal output. The major metals produced are zinc and lead which comprise one half and one fifth, respectively, of New Brunswick mineral output values. Output of both of these metals rose rapidly over the 1968-70 period, revenues for each having increased by one third. Production of zinc, lead, copper and silver is centred around Bathurst.

**Quebec.**—Total mineral output value in Quebec was \$800,000,000 in 1970, a fairly good increase over 1968 and 1969 but only slightly higher than 1966. More than one half of the annual product consists of metallica, non-metallica contributing one quarter and structural materials one eighth of the product. Fuels production in this province is insignificant.

The metallica produced in Quebec are mainly copper and iron ore and the non-metallic output is almost wholly asbestos. Copper, valued at \$201,000,000 in 1970, accounted for one quarter of all Quebec mineral output; iron ore, at \$131,000,000, contributed one sixth. Copper capacity and production increased in the 1968-70 period but iron ore capacity remained stable, as did production (allowing for strikes). Zinc production, at \$63,000,000 in 1970, is also a significant contributor to the mineral output of Quebec but tonnage has declined somewhat from 1968. Asbestos production has been fairly stable in output volume since 1968 but price increases brought revenues up to \$165,000,000 in 1970 and significant expansions were made in mine and mill facilities during the year. Titanium dioxide, produced only in Quebec, is a valuable product with firm world markets; production value increased from \$28,000,000 in 1968 to \$34,000,000 in 1970.

**Ontario.**—Ontario has a mineral production value of more than \$1,600,000,000 annually. Metallica are the great strength of this output and the class showing the greatest recent growth rate; the value of the output of metallica in 1970 was almost 24 p.c. higher than that in 1968. Nickel is the most important of the metallica, contributing 44 p.c. of the province's metallic minerals output value in 1970; copper followed with 24 p.c., iron ore with 10 p.c. and precious metals with 8.5 p.c. The range of output is extremely diverse, more so than in any other province of Canada and the value of metallica production, not including nickel and copper, is almost as great as Quebec's total minerals output value.

Output of fuels in Ontario is very small and the non-metallica produced consist mainly of salt, nepheline syenite, asbestos, sulphur and quartz in small quantities. Structural materials produced in 1970 were valued at \$189,000,000, an amount little changed since 1967 because of hesitancy in the construction industry.

**Manitoba.**—Manitoba's mineral production in 1970 was valued at \$333,000,000, an amount 59 p.c. above the 1968 total. Of the 1970 value, metallic minerals comprised 88 p.c., structural materials 6 p.c., and fuels 5 p.c. Of the total metallica value amounting to \$294,000,000, nickel contributed 72 p.c. and copper 20 p.c.

The rapid rise of mining output in Manitoba is attributable mainly to the recently increased capacity at the nickel-copper mines of Inco at Thompson. Sherritt Gordon at Lynn Lake and Dumbarton Mines at Bird River also produced more in 1970 than in 1968. Manitoba nickel (all forms) production rose by one third in two years—from 58,000 tons in 1968 to 78,000 tons in 1970, the latter being one quarter of the total Canadian nickel output. Zinc produced in Manitoba was valued at \$12,500,000 in 1970; because of labour disputes, both value and tonnage were lower than in 1968 or 1969.

**Saskatchewan.**—Saskatchewan's mineral production, of course, reflects the determines of geography. In contrast to the more easterly provinces, the Canadian Shield formation comprises much less than one half of Saskatchewan's area, nor does Saskatchewan have the Cordillera and related resources that are present in the more westerly provinces. Saskatchewan, therefore, is mainly a non-metallic minerals producer, its major products being oil, natural gas and potash; zinc, copper and uranium are of useful but minor annual output value. Oil output is stable although hesitant, and uranium output continues to decline, but the restoration of order in potash markets through regulation of supply in both Saskatchewan and New Mexico has raised revenues substantially for that product.

The value of total mineral output in Saskatchewan in 1970 was \$393,000,000, a \$50,000,000 increase over 1969 attributable to price increases in potash. The broad picture in the province for the past few years has been one of stable annual value of output. Of the total 1970 output, the fuels class contributed 56 p.c., non-metallics (almost all potash) 32 p.c., and metallics about 10 p.c.

**Alberta.**—Alberta is Canada's major oil producer. Its dominance in Canadian oil production has become steadily firmer, its share of the national output climbing from 69 p.c. in 1967 to 73 p.c. in 1970. Even so, production in the province could be much greater than at present since the developed fields are operating below capacity. Assuming adequate feed and transmission pipe, the barrier to increased output is the regulation by the United States of imports into its mid-continent States. Proven economic reserves of oil are not great; at present production rates, they total about 20 years' supply. Current exploration in Alberta is at a moderate level—significant improvement in new field exploration seems to await the outcome of the economic and environmental studies on the new sources of oil above the Arctic Circle.

Alberta's total minerals output in 1970 was valued at \$1,390,000,000, of which \$1,320,000,000 was fuels; half of the remainder was fuel-by-product sulphur and half was structural materials—mainly cement, sand and gravel—valued at \$37,000,000. Crude petroleum production amounted to 331,000,000 bbl., higher by 14 p.c. than in 1969; unit prices changed little from the two preceding years. Natural gas net new production in Alberta in 1970 was 1,892,000,000 Mcf. compared with 1,606,000,000 Mcf. a year earlier, reflecting continuing strong demand for gas in mid-continental United States.

Alberta's southwest is producing useful amounts of coal, the value of the 1970 output being \$25,700,000 compared with about \$12,000,000 in both 1967 and 1968. Current production should increase a little but coal output may be at a plateau for a few years.

**British Columbia.**—Total minerals output value in British Columbia in 1970 was almost \$500,000,000 compared with \$434,000,000 in 1969 and \$389,000,000 in 1968; the average annual growth in the 1968-70 period was 13 p.c. This production includes a very wide range of products; 60 p.c. is provided by metallics, 25 p.c. by fuels, 10 p.c. by structural materials and 5 p.c. by other non-metallics. Copper is especially significant, comprising one fourth of all minerals-output value. Other valuable metallics are, in order of importance, molybdenum, zinc, lead, iron ore and silver. Even a little tin is produced, as concentrate, when world prices are high. Asbestos and sulphur are among the non-metallic minerals produced and there are also considerable amounts of crude oil, natural gas and coal produced.

Copper production has climbed rapidly; the 110,000-ton output in 1970 was a one-third increase over 1968 and 1969 levels and price increases brought 1970 copper revenues up by almost one half over those for 1968. Molybdenum production volume in 1970 increased by one half over the 1968 output levels to 16,000 tons (contained molybdenum basis) of concentrate but price increases were not large. The coal mines developed over the past few years achieved a sudden increase in output value to \$22,000,000 in 1970 from \$7,000,000 in 1969. British Columbia coal is almost all high-unit-price bituminous coal of coking quality. The enlarged production in 1970 and the foreseen future expansion is for Japanese requirements.

## MINERAL REFERENCES

Locations of mines and mining areas mentioned in the Mines and Minerals Chapter of this volume.

Department of Energy, Mines and Resources Map 900A, revised annually, shows names and locations of all producing mines and the principal oil and gas fields in Canada.

56. Thompson Area—nickel-copper mines, smelter and refinery
57. Wabowden—nickel-copper mine
58. Snow Lake Area—copper-lead-zinc mines
59. Ruttan—new copper-zinc mine
60. Lynn Lake—nickel-copper mine
61. Fox Lake Mine—copper-zinc
62. Flin Flon Area—copper-zinc-lead mines and smelter
63. Esterhazy—potash mine
64. Gulf Minerals—uranium discovery
65. La Ronge—copper mine
66. Estevan—coal mines
67. Belle Plaine—salt mine
68. Uranium City—uranium mine
69. Drake Point—natural gas discovery
70. Yellowknife—gold mine
71. Pine Point—lead-zinc mines
72. McMurray—oil sands (petroleum)
73. Fort Saskatchewan—nickel refinery
74. Wabamoun—coal
75. Strath-Richmond Area—petroleum and natural gas exploratory drilling
76. Coleman—coal
77. Crownest Pass Area—coal
78. Fording—coal
79. Kimberley—lead-zinc mine
80. Cardinal River—coal
81. Golden—lead-zinc-silver mine
82. Bluebell Mine—lead-zinc
83. McIntyre—coal
84. Revelstoke—molybdenum mine
85. Ferguson—lead-zinc-silver mine
86. Slocan—lead-zinc-silver
87. Reeves-MacDonald Mine—zinc-lead
88. Trail—refinery
89. Rossland—molybdenum mine
90. Greenwood—copper mine
91. Brenda Mine—copper-molybdenum
92. Boss Mountain—molybdenum mine
93. Highland Valley Area—copper mines
94. Williams Lake—copper-molybdenum mine
95. Ashcroft—copper-molybdenum mine
96. Giant Mascot Mine—nickel
97. Churchill Copper—mine
98. Endako—molybdenum mine
99. Britannia Mine—copper
100. Texada Mine—iron-copper
101. Buttle Lake—zinc-copper mine
102. Port Hardy—copper-molybdenum mine
103. 10E Atkinson H25—petroleum discovery
104. Anvil Mine—zinc-lead
105. Cassiar—asbestos mine
106. Granduc—copper
107. Alice Arm Area—molybdenum mine
108. Carmacks—coal mine
109. Whitehorse Area—copper and gold mines
110. Arctic Gold and Silver—mine (gold-silver)
111. Wesfrob Mine—iron
112. Clinton Creek—asbestos mine

The rapid growth of mine and mill operations in the province gives great importance to announced provincial policy on the smelting of ores. The British Columbia Government intends that producers process within the province a significant proportion of their mineral output.

**Yukon Territory and Northwest Territories.**—Yukon minerals production comprises metallics—mainly zinc, lead, copper and precious metals—and asbestos. Output is not large by national standards but it is increasing rapidly. In 1970, the \$80,000,000 total output included zinc, \$25,000,000; lead, \$22,000,000; copper, \$9,000,000; silver, \$8,000,000; and asbestos, \$15,000,000.

Northwest Territories mineral output, valued at \$125,000,000 in 1970, is almost wholly metallic minerals plus a little petroleum and natural gas. Output value was fairly steady in the 1968-70 period; moderate increases in the volume output of zinc and lead, which comprised 86 p.c. of the 1970 total value, were counteracted by declining prices leaving revenues unchanged.

A zinc-lead discovery with a large tonnage potential has been made on Little Cornwallis Island in the Northwest Territories. This treeless terrain, which has little vegetation and no permanent ice or snow cover, can be traversed readily by vehicles with outsized tires, and light aircraft so equipped can land almost anywhere.

Two geologists examine a chunk of massive zinc-lead mineralization.

## 6.—Value of Mineral Production, by Province, 1961-70

## Subsection 1.—Metals

The metallic minerals of greatest dollar value to Canada in 1970 were, in order: nickel, copper, iron ore, zinc, lead, gold, silver, molybdenum, uranium and platinum group metals. These 10 metals, which accounted for 97 p.c. of the total value of metal production in 1970, and several other metals of importance are dealt with separately below.

PERCENTAGE DISTRIBUTION OF METALS PRODUCTION  
1970 COMPARED WITH 1961

**Nickel.**—Canada's production of nickel in 1970 amounted to 308,042 tons valued at \$829,643,800, a 44-p.c. increase in quantity and a 72-p.c. increase in value over 1969. A return to full production after strikes in 1969 at the Sudbury-area mines of The International Nickel Company of Canada, Limited (Inco) and Falconbridge Nickel Mines Limited accounted for the large increase. Canada's position as the world's leading producer (56 p.c. of the non-communist world's nickel in 1970) remained intact but its proportion will decline in the mid-1970s as new deposits are opened in New Caledonia, Australia, the Philippines, the Dominican Republic, Guatemala, Venezuela, Colombia, Yugoslavia and Botswana.

In Ontario, where 74 p.c. of Canada's nickel was produced in 1970, Inco operated 11 mines, four mills, two smelters, a copper refinery and a byproduct iron ore recovery plant in the Sudbury area, and a nickel refinery at Port Colborne. The company is preparing four new mines in the Sudbury area and one near Shebandowan for production. Two concentrators and a nickel refinery are also under construction. Falconbridge operated eight mines, four mills and a smelter, and is developing two new mines. At Werner Lake in northwestern Ontario, Consolidated Faraday Limited continued production and sold bulk nickel-copper concentrate to Inco. Noranda Mines Limited is preparing its 700-ton-a-day Langmuir mine, near Timmins, for production in 1972. Texmont Mines Limited has scheduled its 500-ton-a-day nickel-copper mine, near Timmins, for operation in 1971.

In Manitoba, where 25 p.c. of Canada's nickel was produced in 1970, Inco operated an integrated nickel mining-concentrating-smelting-refining facility at Thompson and continued development of two new mines. Sherritt Gordon Mines Limited at Lynn Lake produced nickel concentrates for shipment to the company's chemical refinery at Fort Saskatchewan, Alta. Supplementary feed for the refinery was obtained by importing nickel-sulphide concentrates from Australia. Dumbarton Mines Limited at Bird River continued producing and trucking ore to the Faraday mill. Falconbridge continued development of the Manibridge mine at Wabowden, with production planned for 1971.

Drill jumbo at a Sudbury area nickel mine.

Only one mine produced nickel in Quebec in 1970—the Renzy Mines Limited in Hainault township. In British Columbia, Giant Mascot Mines Limited, near Hope, produced a bulk nickel-copper concentrate for export to Japan.

**Copper.**—The production of copper from Canadian mines amounted to 673,747 tons valued at \$782,490,300 in 1970, an increase of 100,502 tons and \$194,209,703 over 1969 when labour strikes caused a decline in output. Production of refined copper increased to 543,069 tons from 450,154 tons in the same comparison and consumption declined 2,418

tons to 237,838 tons. Exports of copper in concentrates increased by 21,303 tons to 179,119 tons and exports of refined copper increased by 82,369 tons to 292,403 tons.

Six smelters for the reduction of copper and nickel-copper ores and concentrates are operated in Canada. In the Sudbury district of Ontario, Inco operates smelters at Copper Cliff and Coniston, and Falconbridge Nickel Mines Limited produces nickel-copper matte at its Falconbridge smelter. Hudson Bay Mining and Smelting Co., Limited at Flin Flon, Man., smelts ores and concentrates from its own and other mines in Manitoba and Saskatchewan. Ores and concentrates from most of the copper mines in Ontario, Quebec and Newfoundland are smelted at the Noranda smelter of Noranda Mines Limited and the Murdochville smelter of Gaspé Copper Mines Limited, both in Quebec. Major expansion programs are under way at both the Noranda and Murdochville smelters. Electrolytic copper refineries are operated by Inco at Copper Cliff and by Canadian Copper Refineries Limited, a subsidiary of Noranda Mines, at Montreal East, Que. The Montreal East refinery is to be expanded by about 80,000 tons of annual capacity of refined copper.

Ten new mines producing copper were placed in operation and six mines were closed during 1970 in Canada; net production capacity was increased by about 95,000 tons of contained copper during the year. Eight new mines are scheduled to commence operations in 1971 and six are expected to close. Annual capacity should total about 835,000 tons of copper in concentrates by the end of 1971.

Copper production in Newfoundland in 1970 was 15,412 tons valued at \$17,898,600 from four producing mines. In New Brunswick, copper output increased to 7,933 tons valued at \$9,213,100 from 6,791 tons valued at \$6,984,742 in 1969. In Quebec, production was 173,533 tons valued at \$201,542,000, an increase of 13,465 tons and \$36,895,560 over 1969. More than 30 mines were operating during 1970, the main centres of production being at or near Rouyn-Noranda, Val d'Or, Matagami, Chibougamau, Murdochville and Stratford Centre. The Bell Allard and New Hosco mines near Matagami and the Solbec mine at Stratford Centre were closed, while production commenced at the Louvem mine at Louvicourt.

Copper was produced at 35 mines in Ontario in 1970, the main operations being the 19 nickel-copper mines of the Sudbury district, five copper-zinc and copper mines near Timmins, and three copper-zinc mines near Manitouwadge. Mine production amounted to 291,908 tons valued at \$339,022,800, an increase of 53,098 tons and \$94,722,299 over 1969 when strikes at the Sudbury area mines reduced output. Two new small mines were opened during the year and two were closed; eight mines were being developed for production by the end of 1972.

Most of Manitoba's production of 51,445 tons of copper valued at \$59,748,800 came from the mines of Hudson Bay Mining and Smelting Co., Limited at Flin Flon and Snow Lake and, to a lesser extent, from the Lynn Lake mines of Sherritt Gordon Mines Limited. Hudson Bay operated seven mines including the Anderson Lake and Dickstone mines which were brought into production in 1970. Sherritt Gordon began production from its Fox Lake copper-zinc mine at a rate of 3,000 tons of ore daily. Copper rejects from the Inco refinery at Thompson were shipped to Copper Cliff in Ontario for refining. Copper production in Saskatchewan was from the mine of Anglo-Rouyn Mines Limited near La Ronge and from Hudson Bay's Flexar mine and that portion of the Flin Flon orebody that lies on the Saskatchewan side of the provincial boundary. Production in 1970 was 15,548 tons, 2,682 tons less than in 1969; the value was \$18,058,000 or \$693,559 less.

Production of copper in British Columbia in 1970 amounted to 109,647 tons valued at \$127,343,700, an increase of 25,939 tons and \$41,262,489 over 1969. Four new mines started production in 1970; Brenda Mines Ltd., near Peachland, Granduc Operating Company, near Stewart, Churchill Copper Corporation Ltd., near Magnum Creek, and Greyhound Mines Ltd., near Greenwood, began operations at rates of 24,000, 7,000, 750 and 2,000 tons a day, respectively. Two new mines were scheduled for operations in 1971 and four in 1972.

Production of copper in the Yukon Territory, all by New Imperial Mines Ltd., Whitehorse, increased by 317 tons in 1970 to 7,750 tons valued at \$9,000,800. Copper produced in the Northwest Territories is obtained as a byproduct of mining high-grade silver ores.

**Iron Ore.\***—Iron ore shipments amounted to 47,509,000 tons valued at \$589,126,000 in 1970, surpassing the previous record of 42,360,000 tons established in 1968 and well above the 35,763,000 tons shipped in 1969. Domestic shipments at 8,782,000 tons and exports at 38,727,000 tons were both up sharply from 1968. During 1969, the Canadian iron ore industry was unable to produce and deliver as a result of widespread iron ore industry strikes but during 1970 it operated at near capacity. Shipments exceeded production by an estimated 1,500,000 tons and stock at mines and ports, estimated to contain 10,300,000 tons at the end of 1969, went down accordingly.

Increased demand from Western Europe was mainly responsible for the new high in exports and record Canadian steel production accounted for the all-time high in domestic shipments. Crude steel production totalled 12,350,000 net tons, surpassing the previous high of 11,200,000 tons established in 1968. Domestic consumption of iron ore was 11,500,000 tons of which an estimated 9,400,000 tons were of domestic origin and the remainder imports; iron and steel plant stocks amounted to 4,100,000 tons, about 100,000 tons higher than in 1969. The trend toward lower imports continued in 1970 as they declined slightly from 2,260,000 tons in 1969 to 2,125,000 tons.

The Canadian iron ore industry, which began a period of slow growth in 1969, added only 70,000 tons to production capacity in 1970 and an estimated 420,000 tons in 1971. Annual capacity at the end of 1970 was 46,480,000 tons, including 24,830,000 tons of pellet capacity. Three major projects for Quebec-Labrador were announced in mid-1970: a 12,000,000-ton-a-year expansion of Iron Ore Company of Canada's Labrador City con-

\* Quantities of iron ore given in this Section are in long tons of 2,240 lb.

centrator; a new 6,000,000-ton-a-year concentrator and pellet plant at Sept Îles by the same company; and a 16,000,000-ton-a-year concentrator at Mount Wright by Quebec Cartier Mining Company. At least 20 companies, other than producers, were active in 1970 in the geological, metallurgical and economic evaluation of iron ore deposits and/or in the seeking of markets and financing.

In 1970, 18 companies with 19 operations produced 46,984,000 tons of iron ore and byproduct iron ore; 10 were in Ontario, four in British Columbia, two in Quebec, two in Newfoundland (Labrador) and one in Quebec-Labrador. Of the four producing provinces, Newfoundland and Ontario had record shipments of iron ore in 1970. The leading producer was Newfoundland (Labrador) with 22,219,000 tons, a 4,625,000-ton increase over the previous high in 1968, followed by Quebec with 13,079,000 tons, Ontario with 10,493,000 tons and British Columbia with 1,718,000 tons.

In Quebec-Labrador, shipments from Iron Ore Company of Canada totalled 20,108,000 tons comprised of 10,535,000 tons of pellets, 7,625,000 tons of direct-shipping ore and 1,948,000 tons of concentrate. Quebec Cartier Mining Company's production was above rated capacity and some 8,870,000 tons were shipped. Wabush Mines' shipments at 5,478,000 tons, were some 600,000 tons less than capacity and reflected extensive modifications to its pellet plant regrind mills from wet to dry; capacity production is expected in 1971. Shipments from Hilton mines, at 1,030,000 tons, exceeded production capacity by 100,000 tons because of shipments from stockpile.

In Ontario, Griffith mine approached capacity production and shipments totalled 1,503,000 tons. Sherman mine experienced gear difficulties with its three wet autogenous mills and shipments were down from 1969 by 200,000 tons to 914,000 tons. Shipments of pellets from The International Nickel Company were estimated at 667,000 tons, down about 100,000 tons from 1969. The company plans to cut back production to 600,000 tons a year in order to meet the new Ontario regulations with respect to sulphur dioxide emissions. Shipments either exceeded or equalled production capacity rate at all other mines in Ontario. Shipment of reduced iron-nickel pellets from Falconbridge Nickel Mines Limited's new 300,000-ton-a-year plant can be expected in 1971.

In British Columbia, Coast Copper Company, Limited closed the iron ore recovery plant at its copper mine on Vancouver Island because feed from its new orebody was too high in pyrrhotitic sulphur. Two iron mining operations remain in British Columbia—Texada Mines Ltd., an underground operation, and Wesfrob Mines Limited, an open-pit operation; both produced copper concentrate and magnetite concentrate. Wesfrob Mines, which began production in 1967, attained capacity production for the first time in 1970 and shipped 974,000 tons of iron ore concentrate. Shipments from Texada Mines totalled 467,000 tons of iron ore concentrate.

Exports of iron ore, at 38,727,000 tons, surpassed the record of 36,011,000 tons established in 1968 and were considerably more than the 27,906,000 tons shipped in 1969. The export weakness in 1969 was caused by loss of production brought on by labour strikes. Lower demand from the United States was more than offset by record demand from Britain and all European Coal and Steel Community (ECSC) countries. Prospects for Canadian exports in the next decade appear excellent. Of the tonnage exported in 1970, the United States took 23,842,000 tons (26,687,000 tons in 1968), Britain took 4,918,000 tons (3,351,000 tons in 1968), Federal Republic of Germany about 3,900,000 tons including about 1,900,000 tons trans-shipped from the Netherlands (2,100,000 tons in 1968 including about 700,000 tons trans-shipped from the Netherlands), Japan 2,194,000 tons (1,891,000 tons), Italy 1,602,000 tons (1,346,000 tons) and the Netherlands about 1,200,000 tons excluding the trans-shipments to Federal Republic of Germany (400,000 tons excluding the trans-shipments to Federal Republic of Germany). Exports to Belgium and Luxembourg and to Finland were higher than in 1968. Shipments to France, which began in 1969, were up sharply to 295,000 tons. Spain became an importer of Canadian iron ore for the first time in 1970, with 129,000 tons.

**Lead and Zinc.**—Mine production of lead in 1970 reached a record 383,200 short tons, 20.3 p.c. more than in 1969 and representing about 14 p.c. of the non-communist world total. Primary refined lead production of 204,600 tons was derived from two plants—one operated by Cominco Ltd. at Trail, B.C., where annual capacity is 210,000 tons, and the other operated by East Coast Smelting and Chemical Company Limited, a subsidiary of Brunswick Mining and Smelting Corporation Limited, at Belledune, N.B., where annual capacity is 30,000 tons. Exports of lead in ores and concentrates totalled 165,900 tons of contained lead, compared with 140,200 tons in 1969, and went mainly to Japan, the United States, Federal Republic of Germany and Belgium. Exports of refined lead amounted to 152,800 tons, 43 p.c. more than in 1969, and went mainly to the United States, Britain and India. The lead price, f.o.b. Toronto and Montreal, decreased from 16.5 cents a pound at the beginning of 1970 to 14.5 cents on Oct. 1, at which level it stood for the remainder of the year.

Mine production of zinc in 1970 reached a new high of 1,211,300 tons, slightly more than in 1969 and equivalent to over 29 p.c. of the non-communist world total. Canada has been the world's largest mine producer since 1964. Production of primary refined zinc declined to 460,700 tons from 466,400 tons produced in 1969; output was at 86 p.c. of the total rated capacity of Canada's four primary zinc plants. Exports of zinc in ores and concentrates, totalling 846,000 tons, went mainly to the United States, Belgium, Japan and the Netherlands. Refined exports amounted to 351,500 tons and went mainly to the United States, Britain and India. The domestic producers' price for prime western zinc, f.o.b. Toronto and Montreal, decreased from 15.5 cents a pound at the beginning of 1970 to 15.0 cents a pound on Aug. 24, at which level it stood for the remainder of the year.

Production of lead and zinc in the Northwest Territories, amounting to 110,000 and 225,000 tons, respectively, came from Pine Point Mines Limited, where mill capacity was increased to 10,000 tons daily. An exploratory mining program was initiated to develop costs and mining techniques for determining whether some 10,000,000 tons of ore reserves could be more economically mined by underground than by open-pit methods. Production of lead and zinc increased sharply in the Yukon Territory as Anvil Mining Corporation Limited ended its first full year of operations and completed the expansion of its mill capacity from 5,500 to 6,600 tons a day.

Lead and zinc production in British Columbia was mainly from Cominco Ltd.'s Sullivan mine and 10,000-ton concentrator at Kimberley; the company also operated the Bluebell mine and 700-ton mill in the Slokan district. Among other lead-zinc producers were Western Mines Limited at Buttle Lake on Vancouver Island, and Canadian Exploration Limited and Reeves MacDonald Mines Limited in southeastern British Columbia. About mid-1970, Canadian Exploration ceased lead-zinc production because of exhaustion of ore reserves. Two new lead-zinc mines began operations in southeastern British Columbia—Copperline Mines Ltd. and Silmonac Mines Limited at 600 and 150 tons of ore a day, respectively. A third—Columbia Metals Corporation Limited—was expected to begin operations about mid-1971 at its silver-lead-zinc mine and 125-ton-a-day mill near Ferguson.

Hudson Bay Mining and Smelting Co., Limited recovered lead and zinc from base metal ores of three mines at or near Flin Flon on the Saskatchewan-Manitoba border and five mines near Snow Lake, Man. Its Anderson Lake and Dickstone mines in the Snow Lake district were brought into production in November 1970, and two new mines were under development in the Flin Flon-Snow Lake area. About mid-1970, Sherritt Gordon Mines Limited brought its Fox copper-zinc mine and mill, 30 miles southwest of Lynn Lake, Man., into production at 3,000 tons of ore a day. Sherritt Gordon also continued development of its Ruttan copper-zinc deposit in northern Manitoba and planned to bring this open-pit mine into operation by July 1973 at a mill rate of 10,000 tons of ore a day.

In Ontario, Ecstall Mining Limited operated a zinc-copper-lead-silver mine and a 9,000-ton-a-day mill near Timmins and remained Canada's largest mine producer of zinc as well as Ontario's leading producer of lead. Ecstall, a subsidiary of Texas Gulf Sulphur Company, continued construction, near Timmins, of a new electrolytic zinc plant and related

facilities which will initially produce about 120,000 tons of refined zinc metal, 230,000 tons of sulphuric acid and 1,000,000 lb. of cadmium metal annually. The plant, scheduled to open early in 1972, will process zinc concentrates derived from the company's nearby Kidd Creek zinc-copper-lead-silver mine. Other Timmins-district mine producers were Kam-Kotia Mines Limited and Canadian Jamieson Mines Limited, which operated copper-zinc mines and mills. The remainder of Ontario's lead and zinc output came principally from copper-zinc-lead mines at Manitouwadge operated by Noranda Mines Limited, Geco Division, and Willroy Mines Limited. South Bay Mines Limited, associated with Selection Trust Limited of London, England, planned to bring into production by mid-1971 a zinc-copper-silver mine and 500-ton-a-day mill at Uchi Lake in the Red Lake district of north-western Ontario. Mattabi Mines Limited, jointly owned by Mattagami Lake Mines Limited and Abitibi Paper Company Ltd., continued development of its major zinc-copper-silver-lead deposit on the south side of Sturgeon Lake, near Sioux Lookout. Production at 3,000 tons of ore a day was scheduled to begin in mid-1972.

In Quebec, relatively small amounts of lead, as well as some zinc, were produced by the Cupra, D'Estrie and Solbec mines operated by the Sullivan Mining Group Ltd. in the Eastern Townships. The D'Estrie mine was brought into production late in 1970 and the Solbec property was closed about the same time because of exhaustion of ore reserves. Six mining companies associated with Noranda Mines Limited accounted for almost 85 p.c. of the zinc output in Quebec, most of the remainder coming from three mines in the Noranda-Val d'Or area, which operated copper-zinc-silver mines. Lake Dufault Mines Limited developed the Millenbach copper-zinc-silver mine adjoining its original Norbec mine in the Noranda district and planned to bring it into production in late 1971.

In New Brunswick, the largest lead-zinc producer was Brunswick Mining and Smelting Corporation Limited, which operated mines and concentrators in the Bathurst district. Other producers were Heath Steele Mines Limited, which doubled its mill capacity to 3,000 tons a day early in 1970 at its Newcastle area property, and Nigadoo River Mines Limited, which operated a 1,000-ton mill in the Bathurst district. Both companies processed zinc-copper-lead-silver ores. The Anaconda Company (Canada) Ltd. began production from a copper orebody at its Caribou property about 30 miles west of Bathurst, N.B., and continued exploration and development of its main Caribou zinc-lead-copper-silver deposit. A feasibility study was in progress during the year and it was planned to build a 300-ton pilot mill to test the concentration of the complex ore. In Newfoundland, both lead and zinc concentrates were produced at the zinc-lead-copper-silver mine of the American Smelting and Refining Company at Buchans.

Canada's mine production of lead and zinc in 1971 was forecast to be about 10 p.c. and 7 p.c., respectively, higher than 1970.

**Gold.**—Canadian gold production in 1970 amounted to 2,357,620 oz.t. valued at \$86,218,120, a decline of 7.9 p.c. from 1969. The average price for gold paid by the Royal Canadian Mint in 1970 was \$36.57 per oz.t. (Cdn.), down from \$37.69 in the previous year. From 1962 to the end of May 1970, the range in value for the Canadian dollar was \$0.916 to \$0.934 in relation to the United States dollar and the corresponding Royal Canadian Mint price for gold ranged between \$37.46 and \$38.22 per oz.t. On May 31, 1970, the Canadian dollar was allowed to float in the international exchange markets. The price of gold on the London gold market varied from a low of \$34.75 (U.S.) per oz.t. to a high of \$39.19 (U.S.). Rising costs of gold recovery and the unpegging of the Canadian dollar adversely affected the declining gold industry. Of the 32 lode gold mines operating in Canada in 1970 there was only one that did not receive assistance under the terms of the Emergency Gold Mining Assistance Act (see p. 637). The Act was extended to June 30, 1973. Three mines closed in 1970 and one commenced production.

Gold produced from lode gold mines, from base metal ores and from placer mines dropped 9.0 p.c., 0.4 p.c. and 27.0 p.c., respectively, from 1969 levels. Lode gold mines accounted for 78.4 p.c. of the total output, base metal mines 21.4 p.c. and placer mines 0.2 p.c. Ontario was the principal producing province, accounting for 48.5 p.c. of the total; Quebec, the Northwest Territories and British Columbia accounted for 29.0 p.c., 13.6 p.c. and 4.2 p.c., respectively.

In Ontario, production declined 7.0 p.c. to 1,143,920 oz.t. from 1,229,666 oz.t. in 1969; 17 lode gold mines operated during the year; two were closed. Gold recovered as a by-product from base metal ores was 6.2 p.c. of the provincial total. Quebec production declined by 10.1 p.c. to 684,800 from 761,370 oz.t. in 1969; lode gold output was 15.9 p.c. lower. Nine gold mines operated in the province in 1970; one was closed and one commenced production. Gold recovered as a byproduct from base metal ores represented 39.2 p.c. of the provincial total compared with 35.0 p.c. in 1969.

Gold production in the Northwest Territories, which was all from lode mines, was 319,560 oz.t. in 1970 compared with 328,502 oz.t. in 1969. In British Columbia, production amounted to 99,200 oz.t. compared with 117,792 oz.t. in 1969. Gold recovered as a by-product from base metal ores represented 59.4 p.c. of the provincial total. Placer gold recovered was small. The combined gold production for Saskatchewan and Manitoba, all as a byproduct of base metal production, was 77,450 oz.t. compared with 65,573 oz.t. in 1969. In the Yukon Territory production decreased from 29,682 oz.t. in 1969 to 20,400 oz.t., of which placer deposits accounted for 5,000 oz.t. Newfoundland and New Brunswick produced a combined total of 12,220 oz.t. as a byproduct of base metal production.

**Silver.**—Canada's mine production of silver in 1970 was 44,282,700 oz.t., 752,000 oz.t. greater than in 1969 and about 730,000 oz.t. less than the all-time high of 1968. The increase in 1970 resulted mainly from greater output of several base metal mines that produce silver as a byproduct, particularly Anvil Mining Corporation Limited which completed the first full year of operations at its lead-zinc-silver property in the Yukon Territory. Declines

in Newfoundland, Nova Scotia, Ontario and Saskatchewan were more than offset by higher output in the other provinces and the Territories. Ontario was again the leading silver-producing province, primarily because of the substantial byproduct silver produced at the Kidd Creek base metal mine of Ecstall Mining Limited near Timmins. Base metal ores continued to be the main source of Canadian output, accounting for some 92 p.c. of the total. More than 7 p.c. came from silver-cobalt ores mined in northern Ontario and the remainder was byproduct recovery from lode and placer gold ores.

Canadian silver production was valued at \$81,922,980 in 1970. The \$2,091,929 reduction from 1969 resulted from lower prices, which fluctuated between \$2.075 and \$1.609 per oz.t. Reported consumption of silver in 1970 was 6,034,028 oz.t. compared with 5,747,068 oz.t. in 1969, the increase being almost entirely accounted for by the greater use of silver in sterling.

Canadian Copper Refiners Limited at Montreal East, Que., was Canada's largest producer of refined silver, recovering 12,447,000 oz.t. in 1970 from the treatment of anode and blister copper. The silver refinery of Kam-Kotia Mines Limited at Cobalt, Ont., was the second largest producer, recovering 12,187,943 oz.t. in the processing of silver-cobalt ores and concentrates and in the toll refining of silver bullion and coins imported from the United States. Other producers of refined silver were Cominco at Trail, B.C., from lead and zinc ores and concentrates; Inco at Copper Cliff, Ont., from nickel-copper concentrates; and the Royal Canadian Mint at Ottawa, Ont., from gold bullion. At Belledune, N.B., East Coast Smelting and Chemical Company Limited recovered byproduct silver from lead-zinc concentrates treated in an Imperial Smelting Process blast furnace. Late in 1970, it was decided for economic reasons to close down the Kam-Kotia refinery at Cobalt, beginning Apr. 1, 1971 and terminating about mid-1971.

The three largest primary sources of silver in Canada in 1970 were: the Kidd Creek zinc-copper-silver mine near Timmins, Ont., operated by Ecstall; the Sullivan lead-zinc-silver mine at Kimberley, B.C., operated by Cominco; and the silver-lead-zinc mines in the Yukon Territory, about 200 miles north of Whitehorse, operated by United Keno Hill Mines Limited. Expressed as the silver content of concentrates produced, Ecstall recovered 12,233,834 oz.t., Cominco 2,933,096 oz.t., and United Keno 2,663,584 oz.t. Other important mine producers of byproduct silver, in declining order of output, included: Echo Bay Mines Ltd. near Port Radium, N.W.T.; Noranda Mines Limited, Geco Division, at Manitouwadge, Ont.; Brunswick Mining and Smelting Corporation Limited near Bathurst, N.B.; Heath Steele Mines Limited near Newcastle, N.B.; and American Smelting and Refining Company (Buchans Unit), Nfld.

Some 3,168,100 oz.t. of silver were derived from silver-cobalt ores mined in the Cobalt-Gowganda area of northern Ontario; the largest producer was again Silverfields Mining Corporation Limited with an output of 1,119,331 oz.t.

<sup>1</sup> Includes relatively small quantities produced in Alberta.

**Molybdenum.**—Production of molybdenum in Canada in 1970 was 35,300,000 lb. valued at \$62,600,000 compared with 29,600,000 lb. valued at \$53,400,000 in 1969. Canada was second only to the United States among world producers of molybdenum, and supplied approximately 23 p.c. of estimated non-communist world production of 155,300,000 lb.; non-communist world mine production capacity at the end of 1970 was 160,000,000 lb. a year and production in that year exceeded consumption. An excess of capacity is expected to continue for at least four years.

Brenda Mines Ltd., west of Kelowna, B.C., reached production near design-capacity at the end of March 1970 and milled 23,443 tons a day during the remainder of the year; the average milling rate in the last six months was 24,273 tons a day. Grade of ore milled was 0.221 p.c. copper and 0.065 p.c. molybdenum; production for the year was 8,100,000 lb. of molybdenum and 14,313 tons of copper. Molybdenum recovery was 87.25 p.c. and copper recovery was 90.53 p.c. Ore reserves at the end of the year were estimated at 165,000,000 tons averaging 0.182 p.c. copper and 0.049 p.c. molybdenum.

The Mount Copeland mine of King Resources Company, 18 miles northwest of Revelstoke, B.C., came into production at 200 tons of molybdenum ore a day in mid-1970. Ore reserves were estimated by the company at 180,000 tons averaging 1.82 p.c. molybdenite. Annual production should be over 1,000,000 lb. of molybdenum. Endako Mines Ltd. operated at capacity during 1970. Production was 18,200,000 lb. of which 9,400,000 lb. were in molybdenite (MoS<sub>2</sub>) concentrates and 8,800,000 lb. were in the roasted product, molybdic oxide (MoO<sub>3</sub>); the average number of tons milled a day was 27,721, grade of ore milled was 0.182 p.c. MoS<sub>2</sub>, and recovery was 82.39 p.c.; proven and probable ore reserves at the beginning of 1970 were 214,000,000 tons averaging 0.146 p.c. MoS<sub>2</sub>. Boss Mountain Division of Brynnor Mines Limited operated at an annual milling rate of 591,000 tons in 1970. Production was 2,456,000 lb.; ore reserves above the adit level were 2,500,000 tons grading 0.23 p.c. molybdenum; development and stope preparation proceeded below the adit level in preparation for mining some 1,000,000 tons of ore averaging 0.29 p.c. molybdenum. British Columbia Molybdenum Limited, a subsidiary of Kennecott Copper Corporation, operated its 6,000-ton-a-day mine and concentrator near Alice Arm at capacity during 1970; production for the year was about 6,000,000 lb. of molybdenum. Red Mountain Mines Limited, in south-central British Columbia, suspended mining operations temporarily on Dec. 22, 1970, but planned to start milling material from a new ore zone in February 1971. Production in 1970 was 587,455 lb. of molybdenum.

The molybdenum producers in Eastern Canada at the end of 1970 were: Molybdenite Corporation of Canada Limited at Lacorne, Que.; Preissac Molybdenite Mines Limited in the Preissac area near Val d'Or, Que.; and Gaspé Copper Mines Limited, which recovers

molybdenum (377,000 lb. in 1970) at its copper mining operations at Murdochville in the Gaspé Peninsula of Quebec. Cadillac Moly Mines Limited in the Preissac area ceased operation in mid-1970.

Molybdenum and copper-molybdenum properties under development in 1970 included the following. Lornex Mining Corporation Ltd. proceeded with construction and development in preparation for production in early 1972 from its large copper-molybdenum property some 33 miles south of Ashcroft in the Highland Valley of British Columbia. A production rate of 38,000 tons of ore a day is planned from an orebody estimated to contain 293,000,000 tons averaging 0.427 p.c. copper and 0.014 p.c. molybdenum. Annual production is expected to be about 54,000 tons of copper and 2,500,000 lb. of molybdenum. Capital expenditure is estimated at \$120,000,000.

Utah Construction & Mining Co. continued preparation for production at a copper-molybdenum property near Port Hardy in the northern part of Vancouver Island, a 33,000-ton-a-day mining and milling project scheduled for production in late 1971 or early 1972. Capital expenditure is estimated at \$73,500,000. Ore reserves are estimated at 280,000,000 tons averaging 0.52 p.c. copper and 0.029 p.c. molybdenum and annual output is expected to be about 53,000 tons of copper and 1,900,000 lb. of molybdenum.

Placer Development, Limited, announced plans to prepare for production by June 1972 the property of Gibraltar Mines Ltd. in the Cariboo district of British Columbia. Design-capacity is 30,000 tons of ore a day and ore reserves are estimated at over 200,000,000 tons averaging 0.39 p.c. copper and 0.016 p.c. molybdenite ( $\text{MoS}_2$ ). Estimated capital expense of bringing the property into production is \$74,000,000.

Highmont Mining Corp. Ltd. proceeded with development, sampling, metallurgical test-work and feasibility studies on its copper-molybdenum property in the Highland Valley to the east of Lornex. The expected milling rate would be about 25,000 tons of open-pit ore a day and metallurgical recovery tests indicated a recovery of 92 p.c. for copper and 83 p.c. for molybdenum.

The molybdenum property of Adanac Mining and Exploration Ltd., near the Yukon border in northern British Columbia, is undergoing an extensive program of underground drifting, bulk sampling, pilot plant metallurgical tests and production feasibility studies. The work is being carried out by Kerr Addison Mines Limited with the tentative view of bringing the property to production by mid-1973 and acquiring a 60-p.c. interest. Earlier feasibility studies and open-pit designs indicated a waste-to-ore ratio of 1.3:1 for about 70,000,000 tons averaging 0.141 p.c. molybdenite (0.0846 p.c. Mo). Initial laboratory tests indicated a recovery of 90 to 93 p.c. of contained molybdenum.

Other molybdenum and copper-molybdenum properties in British Columbia explored and studied for their production possibilities were those of Bell Molybdenum Mines Limited near Alice Arm, Della Mines Ltd. in the Cassiar district, Sileurian Chieftain Mining Company Limited in the Alice Arm area, and Valley Copper Mines Limited in the Highland Valley.

**Uranium.**—Uranium continued to be in over-supply in world markets in 1970 and the limited short-term prospects were reflected in the operations of Canadian producers. One company continued to operate at near capacity and another announced tentative plans to begin operations in 1974, but two other producers operated at less-than-full capacity and one operation was suspended. The Federal Government's five-year uranium stockpiling program ended in June 1970 but, in view of the poor short-term market situation, the Government announced that it was prepared to offer further assistance to individual producers if their circumstances warranted it.

Of particular significance was the Canadian Government's announcement in March 1970 that it intended to limit the extent of foreign ownership of uranium-producing enterprises in Canada. Basically, it was proposed that the extent of foreign ownership of established uranium producers be limited in the aggregate to 33 p.c., and for any single investor to 10 p.c. However, exceptions were proposed which would allow foreign owners

of existing producers to retain their existing holdings, and would allow foreign investors holding proprietary rights to specific mineral lands prior to Mar. 2, 1970, to be classed as existing producers provided that they develop a commercially viable uranium deposit on the lands within six years. Another proposed exception would allow a single foreign investor who carried a property through the exploration and development stage to hold the full permissible 33 p.c. of ownership. Under all of the exceptions, any transfer of ownership subsequent to Mar. 2, 1970 would have to be to Canadian residents, until the basic ownership limits were reached.

Almost 80 p.c. of production in 1970 came from the Elliot Lake area of Ontario and the remainder from the Uranium City area of Saskatchewan. At Elliot Lake, Rio Algom Mines Limited operated its Quirke mill at capacity, but Stanrock Uranium Mines Limited suspended its underground leaching program following completion of its United States sales contract. Denison Mines Limited had built up at sizable inventory at its Elliot Lake mine over the past four years. Consequently, in 1970 it reached a position where commitments could be met from inventory, permitting a temporary suspension of operations. To prevent this possibility, the company and the Canadian Government entered into an agreement in December under which the Government will provide \$29,500,000 for stockpiling of 6,467,000 lb. of  $U_3O_8$  which will assure Denison a production level of 4,000,000 lb. of  $U_3O_8$  a year over the period 1971-74. At Uranium City, Eldorado Nuclear Limited completed its second year of a planned five-year period of reduced production. Total production of uranium in Canada increased slightly in 1970 to 4,580 tons of  $U_3O_8$  in concentrates, of which 4,010 tons valued at \$50,327,000 were shipped.

Eldorado Nuclear Limited continued to be Canada's only producer of refined uranium products with its refinery at Port Hope, Ont. A new uranium hexafluoride ( $UF_6$ ) plant, designed to convert 2,500 tons of  $U_3O_8$  (2,150 tons of U) to  $UF_6$  a year, was completed at the refinery in April 1970 and the first shipment of the  $UF_6$  was made in October. Because of increasing demand, it is expected that  $UF_6$  will become the refinery's principal product in the 1970s.

Three uranium sales were announced during the year. Early in 1970, Denison confirmed an extension to its long-term 1967 contract with the Tokyo Electric Power Co., calling for an additional 16,750 tons of  $U_3O_8$  over a ten-year period commencing in 1974. In August, Gulf Minerals Company announced that it would proceed with development of its Rabbit Lake deposit in northern Saskatchewan in partnership with a Federal Republic of Germany company which has guaranteed a market for 4,000,000 lb. of  $U_3O_8$  a year; first deliveries are tentatively set for 1974. Rio Algom also announced a small sale to a Federal Republic of Germany utility for 1972 delivery.

A number of negative short-term economic factors caused a decline in uranium exploration activity in Canada in 1970, which accelerated following the Government's announcement relative to foreign ownership. However, companies remained active in the Elliot Lake and Agnew Lake areas of Ontario. A substantial program continued in the Makkovik-Kaipokok area in Labrador, and new occurrences of interest were investigated in the Burin Peninsula of southeastern Newfoundland and in the Philipsburg area of Quebec's Eastern Townships. In Western Canada, activity focused on the Wollaston Lake-Athabasca sandstone area of northeastern Saskatchewan where numerous companies searched for "Rabbit Lake-type" deposits. In the Northwest Territories, investigation of a uranium prospect on the Simpson Islands in the east arm of Great Slave Lake was of particular interest, while other areas of activity were Baker Lake, the Padlei area north of the Henik Lakes, and the Amer Lake area.

Although an upturn in orders for nuclear plants was evident in 1970, uranium continues to be in over-supply in the short term, due in part to delays in committed nuclear programs and in part to increases in maximum production capability in recent years. Uncertainty regarding the disposal of the surplus now available in various government stockpiles and in consumer and producer inventories also strongly influences the short-term situation. However, should markets develop, it is not unreasonable to anticipate that the present

Canadian uranium production capacity of 5,500 tons of  $U_3O_8$  a year could triple by the end of the decade. Increases beyond 13,600 tons a year, however, will require the discovery of new, low-cost reserves for which the geological potential is considered excellent.

#### 15.—Quantity and Value of Producers' Shipments of Uranium ( $U_3O_8$ ), by Province, 1961-70

Year	Ontario		Saskatchewan		Canada	
	Quantity	Value	Quantity	Value	Quantity	Value
	lb.	\$	lb.	\$	lb.	\$

1969.....	..	40,307,489	..	12,843,168	7,707,735	53,150,657
1970 <sup>a</sup> .....	..	40,687,000	..	9,550,000	8,021,000	50,237,000

**Platinum Metals.**—Production of the platinum metals in 1970, which amounted to 461,200 oz.t. valued at \$42,696,000, was 150,796 oz.t. and \$11,815,000 higher than in 1969 when output was reduced as a result of decreased nickel production. Canadian nickel ores contain about 0.025 oz.t. of platinum metals a ton. When nickel matte is electrolytically refined, the platinoids—platinum, palladium, rhodium, ruthenium, iridium and osmium—are precipitated in the electrolytic tanks as a sludge. The sludge is purified and sent to refineries in Britain and the United States for recovery of the platinum metals.

About half of the world's output of platinum metals is from the Soviet Union and most of the remainder is produced in Canada and the Republic of South Africa. Platinum was in short supply throughout the world for the past few years but this condition changed to one of over-supply in 1970. Palladium continued to be in increasing over-supply.

**Cobalt.**—Canada's cobalt production in 1970 was 5,228,900 lb. valued at \$11,900,000 compared with 3,255,623 lb. valued at \$6,800,000 in 1969 when production was reduced by strikes at Sudbury nickel-copper-cobalt mines. Canada is one of the world's major cobalt producing countries, recovering nearly 90 p.c. of its cobalt as a byproduct of nickel-copper ores and the remainder, also a byproduct, from silver-cobalt ores. Approximately half the world's current annual supply of some 22,000 tons of cobalt is produced, as a byproduct of copper recovery, in the Democratic Republic of the Congo; the other principal cobalt producing countries are Zambia, Finland, Morocco and the Soviet Union.

**Columbium (Niobium) and Tantalum.**—St. Lawrence Columbium and Metals Corporation produced 4,886,957 lb. of columbium pentoxide ( $Cb_2O_5$ ) in the year ended Sept. 30, 1970, compared with 3,059,052 lb. in the preceding fiscal year; production during the 1970 calendar year was 4,919,000 lb. St. Lawrence Columbium, with a mine near Oka, Que., is the only Canadian producer of columbium and one of two in the world that produce columbium in pyrochlore concentrates as a principal primary product; the other is a larger producer with a mine near Araxá in Brazil. The demand for columbium continued to improve in 1970. Published spot prices at the beginning of 1970 for Canadian columbium-pyrochlore concentrates, f.o.b. mine site, were \$1.00-\$1.05 (U.S.) a pound of contained  $Cb_2O_5$ ; a price of \$1.15-\$1.20 a pound was established on July 1, 1970 for contract sales and this remained the published price in the latter part of the year.

Canada's first commercial production of tantalum began in 1969 at the Bernic Lake, Man., mine of Tantalum Mining Corporation of Canada Limited. Tantalum pentoxide ( $Ta_2O_5$ ) concentrates were first shipped in the second half of 1969 and in September the company announced a price of \$7 (U.S.) a pound of  $Ta_2O_5$  in 50-p.c. concentrate, f.o.b. mine,

for deliveries contracted through 1970. Tantalum Mining completed its first full production year in 1970 and shipped about 315,000 lb. of tantalum pentoxide. This producer became the principal United States supplier of tantalum in 1970, furnishing 47 p.c. of that country's imports; the Congo (Kinshasa) and Brazil each supplied 18 p.c.

**Cadmium.**—Cadmium output in 1970, expressed as the sum of refined metal and the recoverable cadmium content of exported zinc concentrates, was 4,246,200 lb. valued at \$16,059,000; corresponding figures for 1969 were 5,213,054 lb. and \$18,350,000. The decrease of almost 19 p.c. in the volume of output was apparently due to the treatment of lower-grade ores. Cadmium is recovered as a byproduct during the smelting and refining of zinc ores and concentrates. Most of the zinc ores in Canada carry minor quantities of the metal, varying from 0.001 p.c. to 0.067 p.c. of recoverable cadmium, and zinc concentrates contain up to 0.7 p.c. cadmium. The largest mine production comes from the Kidd Creek mine near Timmins, Ont., followed by Pine Point Mines Limited in the Northwest Territories, Cominco Ltd. in British Columbia, Hudson Bay Mining and Smelting Co., Limited in Saskatchewan and Manitoba, and the Noranda group of companies in Ontario, Quebec and New Brunswick. Refined cadmium is produced at the electrolytic plants of Cominco at Trail, B.C., Hudson Bay Mining and Smelting at Flin Flon, Man., and Canadian Electrolytic Zinc Limited at Valleyfield, Que. East Coast Smelting and Chemical Company Limited, which operates a lead-zinc blast furnace at Belledune, N.B., produced some zinc-cadmium alloy in 1970, and expects to recover refined cadmium by re-distillation beginning in 1971.

**Magnesium.**—Dominion Magnesium Limited, with mine and smelter at Haley Station, Ont., is the only primary magnesium producer in Canada; smelting capacity is 12,000 tons annually. Production in 1970 decreased almost 9 p.c. to 9,584 tons having a value of \$6,478,000 from the 1969 production of 10,637 tons worth \$7,264,000. Value of exports of primary magnesium increased from \$4,261,000 to \$5,562,000 and imports of metal and alloys totalled \$2,177,000. Canadian consumption in 1969 was 5,672 tons. World production in 1970, including communist countries, was estimated at 230,300 tons.

**Selenium and Tellurium.**—Selenium production in 1970 was 604,300 lb. valued at \$5,160,600, slightly higher than in 1969. Tellurium output was 58,900 lb. valued at \$356,400, 8.1 p.c. lower. These metals are recovered from the anode muds resulting from electrolytic refining of copper anodes at the plants of Canadian Copper Refiners Limited at Montreal East, Que., and Inco at Copper Cliff, Ont.

### Subsection 2.—Industrial Minerals

The value of industrial minerals produced in 1970, at \$935,217,800, was about 5 p.c. higher than in the previous year. A continued drop in the value of shipments of elemental sulphur and a decline in the value of structural materials was offset by increased return from sales of potash, asbestos and many other industrial minerals. Developments in a number of industrial minerals during 1970 are reviewed below.

**Asbestos.**—In 1970, 1,654,000 tons of asbestos were produced in Canada, 42,832 tons more than in 1969. The value of output increased about 9 p.c. to \$215,270,000, compared with a 5-p.c. increase in the previous year. Quebec accounts for about 82 p.c. of the Canadian production and Newfoundland, Ontario, British Columbia and the Yukon Territory for the remainder. Most of the Canadian production is exported as milled fibre and shorts, providing 70 to 75 p.c. of world exports and 35 p.c. of world production. The United States, Britain, Japan and Federal Republic of Germany together account for about 62 p.c. of the exports from Canada.

The world outlook for asbestos consumption is favourable. A 4-to-5-p.c.-a-year increase in free world demand (mostly in developing countries) is forecast and Canadian

companies have been modernizing and expanding production facilities to ensure their share of that increase. In Quebec, Canadian Johns-Manville Company, the company with the largest mine, continued mill expansion leading to increased production of 100,000 tons of fibre a year; at Thetford Mines, Asbestos Corporation Limited continued underground development of the Penhale deposit adjacent to the Normandie mine which, if proved successful, will result in new mill capacity of 8,200 tons a day. Asbestos Corporation also expects to put its Asbestos Hill deposit in the Ungava district of Quebec into production by 1972, from which about 300,000 tons of ungraded fibre will be shipped to Germany annually. Bell Asbestos Mines Ltd. proceeded with its new shaft at Thetford Mines. Abitibi Asbestos was negotiating senior financing to bring into production its asbestos property in Maizerets Township, Que. McAdam Mining Corporation Limited at Chibougamau and Abitibi Asbestos Mining Company Limited north of Amos continued exploration and diamond drilling of their respective properties.

In British Columbia, Cassiar Asbestos Corporation Limited completed the expansion of its mill from 75,000 to 110,000 tons of fibre a year and was adding mill equipment to its Clinton Creek mine in the Yukon Territory to increase output to 100,000 tons of fibre a year. Newfoundland's sole producer, Advocate Mines Limited, increased production in 1970 after settlement of a two-month strike in 1969. Ontario's asbestos production increased in 1970 as a result of a full year's output from the Reeves mine of Johns-Manville Mining and Trading Limited and from the Matheson mine of Hedman Mines Limited.

#### 16.—Quantity and Value of Producers' Shipments of Asbestos, 1961-70

Year	Quantity	Value	Year	Quantity	Value
	tons	\$		tons	\$
1961.....	1,173,695	128,955,900	1966.....	1,489,055	163,654,863
1962.....	1,215,814	130,281,966	1967.....	1,452,104	165,118,786

**Potash.**—Canada's potash industry is centred in the Province of Saskatchewan where production started in 1962 and development was so rapid that in 1970 there were 10 mines in operation with a combined annual production capacity of 13,680,000 tons of potassium chloride (KCl). Canada has the world's largest production capacity but this rapid development, coupled with a downturn in fertilizer sales, has resulted in a world over-supply of potash. Canada consumes only about 7 p.c. of its production, the remainder being exported principally to the United States.

The world over-supply of potash created serious marketing problems in late 1969 and 1970. In an attempt to at least partially rationalize the market and to prevent mine closures, the Province of Saskatchewan promulgated the Potash Conservation Regulations, effective Jan. 1, 1970. Under the regulations, production at each mine is allocated using a formula that includes factors of plant capacity, market requirements and inventory needs. The production allowables are reviewed quarterly. Under the regulations, the industry operating rate in 1970 was an average of 45.5 p.c. of capacity. Prices were also regulated under the provincial regulations at not less than 33.75 cents (Cdn.) per unit of  $K_2O$  equivalent.

Canadian production of potassium chloride in 1970 was 3,424,000 tons valued at \$116,402,000, a decrease in volume of 68,000 tons but an increase in value of \$47,019,484 from 1969. Exports of KCl in 1970 totalled 5,473,879 tons valued at \$121,305,000, some 77 p.c. of which went to the United States.

**Salt.**—Salt production in Canada in 1970 was 5,052,000 tons, about two thirds of which was mined rock salt primarily for snow and ice control on streets and highways and for chemical manufacture, and the remainder was fine vacuum salt and salt as brine for use

in producing caustic soda and chlorine. There are three rock salt mines, one in Nova Scotia and two in southwestern Ontario; fine salt evaporator plants and brining operations are located in Nova Scotia, Ontario, Manitoba, Saskatchewan and Alberta. Most of British Columbia's salt needs are met by imports of solar salt from Mexico and the San Francisco Bay area.

17.—Producers' Shipments of Salt, by Province, and Total Value, 1961-70

Year	Nova Scotia	Ontario	Manitoba	Saskat- chewan	Alberta	Canada

**Sulphur.**—Canadian production of elemental sulphur in 1970 was 3,779,850 tons valued at \$30,710,800; sulphur production in all forms including sulphur recovered from smelter gases and contained in pyrites amounted to 4,671,532 tons valued at \$39,841,800. Most of the sulphur produced is extracted as elemental sulphur from sour natural gas in Western Canada. Canada is now the world's largest producer of sulphur from hydrocarbon sources and is the world's largest exporter. Exports in 1970 increased 32 p.c. over 1969 to reach a record 2,988,432 tons. However, because of world over-supply and an extremely competitive market situation, the downward trend in prices which began in early 1969 continued throughout 1970, reaching an all-time low of \$7.43 a ton at the year-end. Despite the substantial increase in exports, value of shipments decreased some 30 p.c. to \$42,861,000.

For the third consecutive year, world producers' stockpiles continued to build up as a result of increased output (notably in Canada and Poland) and slackening demands, especially in the fertilizer industry which consumes some 50 p.c. of sulphur marketed. The ever-increasing involuntary production of sulphur from such sources as sour natural gas and industrial pollution abatement adversely affects establishment of equilibrium within the foreseeable future.

**Gypsum.**—Gypsum production in Canada in 1970 was approximately 6,442,000 tons. Output in general decreased from the previous year, reflecting conditions in the building construction industry in Canada and the United States. About 70 p.c. of Canada's gypsum output is exported to the United States, most of it from Nova Scotia quarries, which account for 75 p.c. of total Canadian production of crude gypsum.

**Nepheline Syenite.**—Nepheline syenite was first produced in 1936 and, until recently when Norway started production, remained a uniquely Canadian mineral commodity. "Nepheline syenite" is a rock name that applies to a mixture of minerals, essentially the feldspars and nepheline. The presence of nepheline provides the mixture with a higher content of alumina (Al<sub>2</sub>O<sub>3</sub>) than has either soda or potash feldspar and makes nepheline syenite more desirable than feldspar in certain applications, especially in the manufacture of glass, for which about 75 p.c. of the output is used. However, markets for finely ground material, used in the manufacture of whitewares such as bathroom fixtures, china, oven-ware, electrical porcelain and ceramic artware, are growing rapidly. Very finely ground material is being increasingly used as a filler material in plastics, foam rubber and paints. Low-grade material is sold in bulk for use in the manufacture of fibreglass and for glazing on brick and tile.

Production originates from two mines in Canada, both located in Ontario on Blue Mountain, some 25 miles northeast of Peterborough. The deposit is pear-shaped, approximately five miles in length and up to one and a half miles in width. Reserves are very large. In 1970, production at 491,000 tons declined slightly from the 500,571 tons produced in 1969 but the value of production increased by \$211,761 to \$6,147,000 in 1970. Some 80 p.c. is exported, most of it going to the United States for use in glass manufacture. In 1970, there was a slight decrease in exports to 387,947 tons valued at \$5,063,000.

## Structural Materials

The value of all construction undertaken in Canada in 1970 was estimated to be \$13,200,000,000, and that of the production of structural materials, including cement, sand and gravel, stone, clay products and lime, was estimated at \$436,768,000. The latter was about 7.5 p.c. of the total value of all mineral production.

**Cement.**—Approximately 8,065,000 tons of cement were produced in Canada in 1970. Although this quantity was under the peak output attained in 1966, its value was the second highest on record. Cement is produced in all provinces except Prince Edward Island but, of the total 1970 quantity, nearly 69 p.c. was produced in Ontario and Quebec. The productive capacity of the Canadian cement industry in 1970 was 14,572,200 tons a year, which included the capacity of a new plant at Kamloops, B.C. Quebec's capacity was increased in 1970 when Independent Cement Inc., at Joliette, added one new kiln capable of providing 220,000 tons a year. A similar addition was scheduled to be made operative in 1971.

<sup>1</sup> Standard portland cement.

<sup>2</sup> Shipments plus imports less exports.

**Sand and Gravel.**—The principal uses for sand and gravel are as aggregate in concrete for building and engineering construction and as fill in road construction. Gravel in boulder sizes is used for rip-rap fill and sometimes for armour-stone construction; the normal scalped, over-size material is crushed to provide gravel and crusher-run fines. Lithologically, sand and gravel deposits are usually composed of material similar to the rock types in which the deposits are found; infrequently, deposits are composed of materials that have been transported some distance from their origin. Exploitation of these low-unit-value materials is greatly influenced by the physical characteristics of the sand or gravel, by the location of the deposit with respect to suitable markets, by the specifications established to differentiate quality products and, more recently, by land use and rehabilitation regulations.

**Stone.**—The stone industry includes those companies producing dimension stone, ornamental stone, crushed stone, whiting, and stone for metallurgical and chemical use. Dimension stone products account for less than 1 p.c. of the total volume of stone production and about 10 p.c. of the total value. Crushed stone products, consisting of materials used for concrete aggregate, railway ballast, road metal, rubble and rip-rap, terrazzo, stucco and artificial stone, etc., account for about 80 p.c. of the total volume; the remainder is used in the chemical and allied industries.

<sup>1</sup> Excludes limestone used to make lime or cement.

**Clay Products.**—Common clays and shales occur in most regions of Canada and are the principal raw materials used for brick and tile manufacture. Deposits of high-quality argillaceous materials used for such products as papers, refractories, high-quality white-ware, and stoneware products are relatively scarce in Canada. Consequently, china clay (kaolin), fire clay, ball clay, and stoneware clay are mostly imported. The value of production of clay products from domestic clays reached a record \$51,165,915 in 1969 and dropped to \$44,059,000 in 1970.

Table 24 refers to production of such products as brick and tile made from domestic clays. Imports of these products, mainly from the United States, have a low total value. Other clay products such as floor and wall tile, sanitary ware, pottery and dinnerware, and electrical porcelain contain a large proportion of china clay and ball clay. The value of whiteware products produced in Canada from such materials approached \$40,000,000 in 1969.

### Subsection 3.—Petroleum and Natural Gas

The steadily increasing demand for oil and gas spurred exploration for new reserves over a broad front in 1970. Significant additions to reserves were again achieved in traditional exploration areas in Canada, particularly in the foothills belt of Alberta and northeastern British Columbia. Nevertheless, record production rates held additions to natural gas reserves to the lowest level in recent years and proven reserves of petroleum declined for the first time since the discovery of oil at Leduc in 1947. The lack of major new oil discoveries in the Prairie Provinces has prompted a shift in exploratory attention to Canada's frontier regions where the tempo of exploration has accelerated in recent years. These remote regions include the Arctic Islands and offshore from British Columbia and the Maritime Provinces. Drilling off the Nova Scotia coast produced a potential commercial oil and gas deposit on the western tip of Sable Island in late 1971, and two major gas discoveries in the Arctic Islands during the past two years are indicative of the future potential of that area, which is large indeed.

Continuing strong demand for Canadian oil and gas in United States markets contributed significantly to the production gains of 1970. Total production of all liquid hydrocarbons—crude oil plus natural gas liquids—increased by almost 13 p.c. to 1,477,000 bbl. daily. Net production of crude oil averaged 1,260,000 bbl. a day and field and gas-plant production of natural gas liquids reached 217,000 bbl. a day. Alberta production, at 925,000 bbl., accounted for 73.2 p.c. of the total Canadian daily crude oil output, 17 p.c. more than in 1969. Production increased in all producing provinces and territories except Ontario where the decline was slight.

Total liquid hydrocarbon reserves declined to 10,439,000,000 bbl., comprised of 8,558,000,000 bbl. of crude oil and 1,880,000,000 bbl. of natural gas liquids. Reserves added in 1970 totalled 440,000,000 bbl. and, of this amount, 325,000,000 bbl. were attributed to revisions, 81,000,000 bbl. to extensions of existing fields and only 33,000,000 bbl. to new discoveries. Since production was 539,000,000 bbl. in 1970, total proven reserves showed a net decline of 99,000,000 bbl. for the year. Alberta accounted for 89 p.c. of Canada's proven liquid hydrocarbon reserve at the end of 1970.

Net withdrawals of natural gas rose 15.1 p.c. to 6,237,000 Mcf. daily in 1970 in response to increasing demand in both domestic and export markets. Proven remaining marketable reserves rose by 2.7 p.c. to 53,375,628,000 Mcf. in 1969, one of the lowest increases in recent years. Exports of crude oil and products to the United States increased to 732,000 bbl. a day in 1970 with an estimated well-head value of \$732,000,000. Although exports reached record proportions, imports of crude oil and products still exceeded exports by 27,000 bbl. a day, the daily average being 759,000 bbl.

<sup>1</sup> Gross production, less field flared and waste, injected and stored.

**Alberta.**—Both exploratory and development drilling footages declined in 1970, which may be attributed to the continuing lack of significant oil discoveries that has persisted in Alberta for the past five years. Probably the only bright spot in recent oil exploration has been the discovery of the Meekwap-Nisku field in west-central Alberta which by year-end appeared to be developing into a medium-size oil field.

*Electric lights burn constantly on this drilling rig at Atkinson Point, 50 miles northeast of Tuktoyaktuk in the Northwest Territories where oil was discovered on Jan. 14, 1971.*

*A massive offshore oil exploration rig, built by Halifax Shipyards, moves into Bedford Basin, past Bedford Institute's research ships, to join other drilling rigs in the search for oil off Canada's Atlantic Coast.*

Exploration for natural gas, on the other hand, increased in 1970, particularly in the shallower horizons. Improved economics resulting from higher gas prices and new drilling and production techniques have increased the attractiveness of shallow gas-bearing sandstones in southern Alberta. Substantial reserves have been developed in these formations which were previously undeveloped because of production difficulties. Exploration and development also continued at a high level in western Alberta along the margins of the folded belt where operating costs are higher but reserve potential is also higher. Significant new reserves were outlined by new drilling in the Strachan-Ricinus area. The Ricinus west field was extended over five miles by recent step-out drilling and, as a result, has now been enlarged with the inclusion of an additional 37 sections at its southern end. The Strachan field limits have also been extended to the northwest in the same general area.

Great Canadian Oil Sands Limited's bituminous sands plant at Fort McMurray has been plagued with operating problems since it came on production in 1967 and in 1970 a maintenance shutdown in August restricted output for three months, thereby lowering the annual average production. Nevertheless, in September, production reached a record 52,000 bbl. a day of synthetic crude oil and if this level can be maintained there should be no problem in meeting an authorized annual production of about 16,400,000 bbl. during 1971.

The total number of wells drilled in 1970 was 1,824, down by 19 from 1969. Total footage drilled was 7,776,993 feet; development footage was 3,325,273 and exploratory drilling 4,451,720 feet, both lower than in the previous year.

**Saskatchewan.**—There has not been a significant oil discovery made in Saskatchewan for several years and, as a result, both development and exploratory drilling are beginning to show an accelerated rate of decline. Exploratory drilling at 1,081,004 feet declined 44 p.c. in 1970 and development drilling at 1,398,639 feet was down 19 p.c. In 1970, only minor accumulations of oil were discovered around the peripheries of established fields, particularly in the southwestern corner of the province where drilling activity has remained relatively stable. Most of the development drilling was confined to the heavy oil belt of western Saskatchewan where fields in the Lloydminster area are still being actively expanded.

**British Columbia.**—Drilling footage increased slightly in 1970 over the previous year but this was due mainly to exploration and development of the province's natural gas resources, encouraged by the growing export and domestic market for this commodity. The Devonian Slave Point trend north and east of Fort Nelson continued to be actively explored and exploratory efforts were rewarded by an indicated discovery at Atkinson Sunlite Helmet b-2-k, 80 miles northeast of Fort Nelson. A number of potential Slave Point gas discoveries have been drilled in the same general area and have been capped pending construction of pipeline connections. Farther south, additional Slave Point gas development wells were drilled in and near the established fields in the Fort Nelson area.

In the offshore area of Western Canada, Shell Canada Limited completed its drilling program in 1969 and since that time industry interest in this area has not been revived.

**Manitoba.**—Both development and exploratory drilling declined to the lowest level since the province's initial oil discovery was made in the early 1950s. Aggregate drilling totalled 55,000 feet in 1970 compared to 146,000 feet in 1969. The lack of success in finding reserves in pre-Mississippian formations, particularly the Devonian, has contributed to a steadily declining discovery rate in the past 10 years. However, companies continued to evaluate the onshore extension of the sediments underlying the Hudson Bay area which is the only remaining unexplored area with a potential for significant accumulations of oil and gas. A core-hole, located about 115 miles southeast of Churchill, was drilled to a depth of 1,401 feet but the results of this test have not yet been released.

**Yukon Territory, Northwest Territories and Arctic Islands.**—The expectations held by the petroleum industry for exploratory drilling in Canada's frontier areas came closer to reality in 1970 with the announcement of two spectacular discoveries—oil at Atkinson Point on the mainland and gas on King Christian Island. The Atkinson Point discovery was made in early 1970 in the Mackenzie delta region and subsequent step-out drilling was unsuccessful indicating that the discovery was not large. However, early in 1971, the future potential of this region became apparent when two separate discoveries were reported in the area immediately to the west of the Atkinson well—one oil and the other gas and condensate. The significance of these discoveries in terms of reserves has not yet been determined.

Farther north, Panarctic Oils Ltd. was in its third season of the costly search for oil and gas in the Arctic Islands. Panarctic is an industry-government company consisting of 20 companies in partnership with the Federal Government, which holds a 45-p.c. financial interest in the organization. To the end of 1970, about \$50,000,000 had been spent on exploration programs which had yielded two large gas discoveries—the first on Melville Island in 1969 and the second, in late 1970, on King Christian Island. Although it is too early to estimate the magnitude of the 1970 discovery, industry officials say that it could be one of the largest natural gas reservoirs ever discovered in Canada. The rising level of exploratory activity in the Arctic Islands increased in tempo with several more drilling ventures undertaken in 1971. Total footage drilled, all exploratory, increased substantially in 1970 to 70 wells (361,710 feet) from 56 wells (274,401 feet) in 1969.

**Eastern Canada.**—The search for major new reserves off Canada's East Coast covered a broad area in 1970 and, although no commercial discoveries were made, encouraging oil and gas shows were encountered in several tests. Shell Canada Limited completed the 13th well in its extensive offshore drilling program in the Atlantic off Nova Scotia and at year-end was drilling its 14th and 15th. The tests were spread over an area extending from about 150 miles southwest of Halifax to a point about 220 miles east of Halifax, although most of the wells were located within a 100-mile area to the north and south of Sable Island. In addition, two wells were drilled in the area between Prince Edward Island and Cape Breton Island and another four exploratory wells were completed in Quebec, two of which were drilled on islands in the Gulf of St. Lawrence. None of these was successful. Drilling activity accelerated and late in the year was rewarded by an oil and gas-condensate discovery on Sable Island. Future drilling will determine the size and significance of this discovery.

In Ontario, total footage drilled amounted to 308,000 feet—a 24-p.c. decrease over 1969. Exploratory drilling at 147,152 accounted for 48 p.c. of the total, down 53 p.c. from the previous year.

**Petroleum Refining and Marketing.**—Daily crude oil refining capacity continues to increase year by year, the total in 1970 reaching 1,352,250 bbl. Canada ranks ninth in the world in terms of crude treating capacity and is unquestionably one of the most advanced countries in terms of down-stream refinery units such as catalytic cracking and catalytic reforming.

In 1970, Canadian refineries received 1,280,000 bbl. of crude oil daily, of which amount domestic oil accounted for 55 p.c. Imported crude, on an average daily basis, amounted to 572,000 bbl. with 364,000 bbl. coming from Venezuela, 55,000 from Iran, 48,000 from Nigeria, 29,000 from Saudi Arabia, 23,000 from Iraq, 20,000 from Colombia, 14,000 from Trucial States, 13,000 from Kuwait and 6,000 from Trinidad. Imports of refined products decreased to 197,000 bbl. daily, a loss of 6,000 bbl. from the daily total for 1969. Heavy fuel oil, light fuel oil, diesel and motor gasoline were the major categories of imports.

<b>Canada.....</b>	<b>646,319</b>	<b>488,748</b>	<b>662,953</b>	<b>521,844</b>	<b>709,496</b>	<b>570,794</b>

Domestic demand in 1970 was made up of 1,399,000 bbl. daily of sales to consumers and 94,000 bbl. daily used at refineries, a total of 1,493,000 bbl. daily compared with the 1969 level of 1,404,000 bbl. Exports of crude oil, all to the United States, averaged 669,770 bbl. daily and refinery product exports amounted to 16,072 bbl. daily.

**Natural Gas Processing and Marketing.**—Natural gas consumers and gas pipeline companies require gas that contains relatively little non-flammable content and is free of noxious components. Since a large proportion of gas produced in Canada does not meet market specifications, there is a major gas processing industry located mainly in Alberta which extracts ingredients that, in themselves, are valuable. These byproducts include propane, butanes, pentanes plus and elemental sulphur. At the end of 1970, there were 153 gas plants operating in Canada—138 in Alberta, four in British Columbia, seven in Saskatchewan and four in Ontario. The addition in 1970 of 1,531,000 Mcf. daily of raw gas treating capacity raised the total to 10,427,000 Mcf. daily.

Of the 2,535,000,000 Mcf. of Canadian gas plus imports of 10,860,000 Mcf. available for consumption in 1970, 779,487,000 Mcf. went to the United States, 917,441,000 Mcf. was sold to residential, commercial and industrial consumers in Canada, and the remainder was used by the industry in pipeline, field or plant use. In total, 1,154,200,000 Mcf. of gas was consumed in Canada compared with 1,027,200,000 Mcf. in 1969.

Table 29 shows sales of natural gas in Canada as well as the number of customers. During 1970, natural gas supplied roughly 23.5 p.c. of Canada's energy requirements.

## Subsection 4.—Coal

The Canadian coal industry recorded the largest percentage increase in production for a single year in 1970. Total production increased 55 p.c. to 16,600,000 tons valued at \$86,000,000. Regionally, production in 1970 decreased 24 p.c. in Eastern Canada and increased 90 p.c. in Western Canada. For the first time in 17 years, the industry produced more than 16,000,000 tons of coal. Revival of the Western Canada coal industry is directly attributable to the growth of two developing markets—the Japanese steel industry and the domestic thermal-electric generating industry. Export shipments, virtually all to Japan, increased 220 p.c. to 4,400,000 tons, compared with 1,400,000 tons in 1969. Landed coal imports increased slightly to 18,900,000 tons. All imported coal entered from the United States, principally for consumption in Ontario. Of the estimated 31,000,000 tons of all types of coal consumed in Canada in 1970, 15,200,000 tons were used to generate electric power. For the same period, 8,100,000 tons of bituminous coal were carbonized to produce 5,700,000 tons of coke and the remainder was used principally for industrial and commercial heating purposes.

In 1970, the Canadian coal industry began a period of unprecedented growth which is expected to continue throughout most of the decade. During the year, three new coking coal mines—Kaiser Resources Ltd., Cardinal River Coals Ltd., and McIntyre Porcupine Mines Limited—commenced production. A new mine operated by Alberta Coal Ltd. began production of subbituminous coal. Total coal production capacity was increased by 4,000,000 tons in 1970; 4,000,000 additional tons were to be added in 1971 and 3,000,000 additional tons in 1972. None of the new mines reached full production capacity in 1970 but all were expected to be at full capacity by late 1971.

## 30.—Coal Production, by Province, and Total Value, 1961-70

Year	Nova Scotia	New Brunswick	Saskat- chewan	Alberta	British Columbia	Yukon Territory	Canada <sup>1</sup>

<sup>1</sup> Prior to 1964, figures include coal ex-warehoused for ships' stores from Canada. <sup>2</sup> Coal and coke. <sup>3</sup> Excludes briquettes. <sup>4</sup> Includes foreign coal re-exported

**Provincial Production and Mine Developments**

**British Columbia.**—In 1970, production of low- and medium-volatile bituminous coals more than tripled to reach some 3,500,000 tons, as Kaiser Resources commenced production from its Harmer Ridge surface mine in the Crowsnest Pass area of southeastern British Columbia. Virtually all Kaiser's output is committed to Japan under long-term contracts valued in excess of \$1,000,000,000. Although difficulties were experienced relating to Kaiser's initial mining plan and operation of its preparation plant and dryer, these problems were expected to be overcome by late 1971 so that contractual obligations would be met.

During 1970, Fording Coal Limited continued preproduction developments at its medium volatile bituminous coal property located along the Elk River, 35 miles north of the Kaiser mine. Production is expected in early 1972 with shipments being made to Japan through the deepsea terminal at Roberts Bank, Vancouver. Fording's present export contract with Japanese steelmakers calls for 45,000,000 long tons to be delivered over a 15-year period.

There was considerable coal exploration carried on throughout 1970-71, mainly in the Crowsnest Pass area.

**Alberta.**—Alberta is Canada's leading coal-producing province and has the greatest number of coal mines. Some of these are relatively small, although the recent trend has been to larger but fewer mines to meet expanding markets. Most of the bituminous coal production is exported to Japan for steelmaking while subbituminous output is used mainly by thermal generating plants in Alberta. In 1970, total coal production increased by over 50 p.c. with bituminous output more than doubling.

Two new mines commenced production of high-grade coking coals in 1970. The new surface mine of Cardinal River Coals Ltd. in the Luscar area began production for export to Japan of some 15,000,000 long tons over 15 years. Approximately 80 miles northwest of Luscar, at Smoky River, the new underground mine of McIntyre Porcupine Mines Limited began production in May. McIntyre also has a 15-year contract but for delivery of 30,000,000 long tons to Japanese steelmakers.

With the high demand for subbituminous coals for thermal power generation, the major producing surface mines expanded operations. The new Highvale mine, owned by Calgary Power Ltd. and operated by Alberta Coal Ltd., started production on the south shore of Lake Wabamun. This mine is adjacent to Calgary Power's new Sundance coal-fired thermal generating station which will require 5,000,000 tons of coal annually when fully developed.

Exploration was very active during the year for both coking and thermal coals.

**Saskatchewan.**—Production of lignitic coals from the Estevan area of southeastern Saskatchewan reached a record in 1970 as demand from thermal generating plants increased. Shipments rose not only to Saskatchewan plants but to Manitoba and Ontario as well. Due to shortages of United States coals, Saskatchewan lignite was used for the first time in significant quantities by Ontario Hydro in two of its southern Ontario generating plants.

**Yukon Territory.**—In 1970, Anvil Mining Corporation Limited continued to produce small amounts of coal at Carmacks for its lead-zinc operation at Vangorda Creek. In the southern part of the Territory, a number of companies carried on exploration activities for coal.

**New Brunswick.**—Coal production was down about 40 p.c. in 1970 due to the gradual phasing down of the coal industry in the province. The provincially owned corporation, N.B. Coal Limited, completed its first full year of managing and operating the New Brunswick coal mines. New Brunswick coal is used chiefly for local thermal power generation by the provincial utility company.

**Nova Scotia.**—In 1970, Nova Scotia coal production declined by about one fifth to 2,100,000 tons from nine operating mines. The largest producer, Cape Breton Development Corporation (DEVCO), proceeded with some modernization of existing collieries and continued development of a new mine at Lingan scheduled for opening in 1974. Chief markets for Nova Scotia coal are thermal power generation and coke-making.

## Section 2.—Government Aid to the Mineral Industry

### Subsection 1.—Federal Government Aid

Federal assistance to the mining industry takes the form of the provision of detailed geological, geophysical, topographical, geodetic, geographical and marine data which are of basic importance to the discovery and development of the mineral resources of Canada; the provision, through laboratory and pilot-plant research, of technical information concerning the processing of ores, industrial minerals and fuels on a commercial scale; financial and technical assistance to the gold-mining industry under the Emergency Gold Mining Assistance Act; and certain tax incentives.

**The Department of Energy, Mines and Resources.**—The federal Department of Energy, Mines and Resources was created by the Government Organization Act on Oct. 1, 1966 (RSC 1970, c. E-6). Apart from its administrative establishments, the Department is made up of three Sectors—Science and Technology, Mineral Development and Energy Development—each headed by an assistant deputy minister and each aiding the Canadian mineral industry according to its assigned responsibility.

The *Science and Technology Sector* contains the Mines Branch, the Geological Survey of Canada, the Surveys and Mapping Branch, the Earth Physics Branch, the Atlantic Geosciences Centre, the Polar Continental Shelf Project and the Remote Sensing Centre.

The Mines Branch is a large laboratory and pilot-plant complex carrying out applied and basic research to discover new and better methods of ensuring mine safety, extracting and refining ores and other minerals, and using metals and minerals in industry and defence. Gratifying results are being achieved in the extraction of metals from ores and in the refining of low-grade crude oil, in the automation of grinding circuits and cyanide leaching processes in gold mills and in the leaching of ground or crushed uranium ores by bacteria; an example of work that has resulted in direct economic benefit has been the development of a process to produce metallurgical coke from western Canadian coal, made possible by a long-term contract to export coke to Japan. In pyrometallurgy—the extraction of metals by heat—applied research is concentrated principally on the combination of shaft and electric furnaces for smelting iron ore. In petroleum refining, research concerns hydrogenation, catalytic cracking, and catalyst development. This work is highly significant because of the opening-up of unconventional sources such as the Athabasca tar sands and the so-called Colorado oil shales, whose economic importance has been recognized by the Mines Branch for many years. A close tie-in with producers is maintained in mineral processing in which the emphasis is on the concentration of metallic ores and on the processing and improvement of industrial minerals. In the field of mineral sciences, the physical, chemical, crystallographic and magnetic studies being undertaken on sulphide minerals are of fundamental interest. In physical metallurgy, experiments on new alloy combinations continue to yield valuable practical benefits for Canadian industry.

The Mines Branch is assisted in its work by the National Advisory Committee on Mining and Metallurgical Research, comprised of senior executives and researchers from industry, government and universities. On the advice of this Committee, the Mines Branch awards an annual series of research grants in mining sciences to Canadian universities. In 1970, the total amount distributed was \$112,000.

The Geological Survey of Canada maps and studies the geology of Canada. It is the major organization engaged in this work in Canada and its studies extend to all provinces and territories. Its activities are designed to support two programs of the federal Department of Energy, Mines and Resources, the Mineral and Energy Resource Program and the Earth Science Program. A principal aim of the former is to ascertain the mineral and energy resources potential available to Canada and thus the Survey expends considerable effort in such fields as the estimation of the potential abundance and probable distribution of mineral and fuel resources. This is done by providing the necessary systematic geological framework, by establishing settings favourable to the occurrence of the various types of mineral commodities and fuels and by comparing these by appraising foreign mineral and fuel resources and by other studies. The Earth Science Program includes activities designed to assist in effective use and conservation of resources and in the management and preservation of man's environment throughout Canada. To assist in this, the Geological Survey provides geologically based information on land resources and terrain performance which is derived from geological, geomorphic, geophysical, geotechnical and related studies of earth and rock materials, land forms and associated dynamic processes.

In support of these activities, the Survey each year sends about 100 parties into various parts of Canada. The results of its studies are published in memoirs, bulletins, papers, maps and numerous scientific technical journals. Headquarters are in Ottawa but there are several regional offices of which the Institute of Sedimentary and Petroleum Geology in

Calgary is the largest. Research grants to Canadian universities made by the Survey totalled \$278,000 in 1970, and were awarded on the recommendation of the National Advisory Committee on Research in Geological Sciences.

The Earth Physics Branch carries out much geophysical work of interest to the mineral industry. It studies, collects and publishes, in the form of maps and charts, information on the geomagnetic field in Canada. Most of the information published is obtained from airborne geomagnetic surveys, which have ranged over the whole of Canada and across the Atlantic to Scandinavia. In addition, the Branch has a network of 10 permanent geomagnetic observatories, as well as temporary observatories in summer at many widely distributed sites. It also operates a network of 29 seismic stations to assist in the study of the earth's interior and to obtain data for its quantitative assessment of seismic risk throughout Canada. In gravity research, another means of studying the composition of the earth's crust, the Branch is systematically mapping variations in the earth's gravity on a regional basis throughout Canada, including the Arctic and the floors of the Gulf of St. Lawrence and Hudson Bay. The results of all gravity measurements to the end of 1966 are available in a new Gravity Map of Canada on a scale of 1:5,000,000, or about 80 miles to the inch, for easy comparison with the new Geological and Tectonic maps of Canada on a similar scale.

The Atlantic Geosciences Centre is located in the Bedford Institute at Dartmouth, N.S. Its geologists and geophysicists study and investigate the deep structure of the continental shelves and the floors of the open ocean. The importance of this work can be seen in the light of the rapidly increasing interest in the potential mineral resources of continental shelves and of the world ocean. EMR scientists also study material from offshore wells drilled by industry. Information gained from wells, when integrated with that from marine geological and geophysical surveys, provides the geological framework from which (a) the oil and gas potential may be estimated and (b) geological conditions evaluated to permit the regulation and supervision necessary to attain orderly and safe exploration of offshore fuel resources. Because of the surge in exploration for petroleum in Eastern Canada's sedimentary basins and the Gulf of St. Lawrence, EMR's geological and geophysical research is of great interest and value to the petroleum industry.

No mineral development is possible without accurate, large-scale topographical maps. The Surveys and Mapping Branch, in conjunction with the Mapping and Charting Establishment of the Department of National Defence, has completed the topographical mapping of the country at the medium scale of 1:250,000, or about four miles to the inch. About 40 p.c. of the larger-scale mapping at 1:50,000 has been completed in the more settled areas and areas of greater economic importance.

The *Mineral Development Sector* is composed of the Mineral Resources Branch and the Explosives Division. The Explosives Division is responsible for the administration of the federal Explosives Act which is primarily an Act of public safety to control the manufacture, authorization, storage, sale, importation and transportation by road of explosives.

The Mineral Resources Branch is responsible for resource-economic research, program development and policy formulation in the field of non-renewable resources. It conducts fundamental and applied resource-engineering-economic research and field investigations into non-renewable resource problems, policies and programs on a commodity or total industry basis, in a regional, national and international context. The work covers all aspects of the mineral industry from resources through exploration, development, production, processing, transportation and consumption. On the basis of this work, the Branch publishes resource-engineering-economic reports and advises government departments and agencies on non-renewable resource policy matters. Current activities include regional studies of the mineral economy of a number of areas in Canada; assessment of mineral projects in various parts of Canada for which federal support has been requested; mineral resource and mineral reserve studies in a number of mineral commodities, including the mineral fuels, uranium and coal; and the safeguarding of Canadian mineral interests through participation in international agencies such as the United Nations Lead-Zinc Study Group,

the Economic Commission for Europe, the Committee on Natural Resources on ECOSOC, and the International Tin Council. The Branch administers the Emergency Gold Mining Assistance Act as a means of aiding a number of mining communities largely dependent upon the gold mines. In collaboration with the Canadian International Development Agency and with the support of industry, the Branch is setting up training courses for mineral scientists, technologists and economists brought to Canada under the various aid programs, and is advising on mineral projects undertaken by Canada as an aid to developing countries. The Branch publishes an extensive series of reports and other material, and maintains the Mineral Occurrence Index, which is a listing of about 10,000 mineral showings and deposits in Canada that may be consulted by anyone interested.

The *Energy Development Sector* examines energy in all its forms—coal, oil, gas, uranium, and conventional and nuclear-generated electric power—to ensure that national development policies are related in the most effective and economic way to Canadian needs. As policy considerations must have regard to the total energy picture, the Sector studies and assesses individual projects and developments relative to each of the energy sources and in terms of interrelationships with other energy sources. It appraises trends in oil and gas exploration and production, transportation, processing and marketing in Canada and on an international scale, advises other federal departments on oil and gas policy related to their responsibilities, and provides information to industry and the general public on oil and gas developments in Canada and abroad. In the field of uranium, the Sector continues its co-ordination with federal departments concerned with uranium matters, on such subjects as stockpile programs, possibilities of the establishment of uranium-enrichment facilities in Canada and export opportunities. It analyses Canadian and foreign nuclear energy programs and assesses opportunities for nuclear reactors in Canada. In coal energy, it initiates evaluations to determine the extent of Canadian coal reserves and their quality, provides assistance in the form of research and development grants to help improve the quality and utilization of coal, provides advice on production expansion rates compatible with profitability and projected demand in Canadian and foreign markets and undertakes studies on the interrelationships of the quality of coal, world price structures, transportation costs, inter-agency competition and environmental concerns. In electric energy, the Sector is concerned with the production and transmission of electric energy throughout Canada with special emphasis on power-system planning and with requisite consideration to the economic and environmental factors associated with the development and production of electric power. It studies auxiliary systems, such as power-system control, communication, fuel supply and storage relative to power generation and transmission and the development and improvement of electrical equipment and prime movers. It administers and manages the federal interests in mineral resources offshore from Canada's East and West Coasts and in the Hudson Bay region, as well as those federally owned mineral rights in the provinces that become available for disposition. It makes policy recommendations on offshore resources, provides representation and expertise in dealing with interdepartmental, federal-provincial and international offshore matters, and provides for co-ordination between government and industries concerned with the utilization of offshore areas.

**Tax Incentives to the Mineral Industry.\***—Although mineral industry enterprises are subject to federal income tax, there are certain benefits granted to such enterprises under the Income Tax Act which serve as incentives to exploration and development of minerals.

New mining operations based on metallic mineral deposits and most industrial mineral deposits are exempt from income tax for the first three years of operation. The three-year exemption does not apply to oil and gas wells, but does apply to the mining of oil shales and bituminous sand.

\* As at October 1971; at that time, Bill C-259—an Act to implement a reform of the Income Tax Act—was before Parliament. The provisions of that Bill modify substantially the benefits accorded to the mineral industry.

The operators of oil or gas wells or mines may claim, during the full life of the operation, a depletion allowance which is equal to one third of the taxable income. In general, the effect of the percentage depletion allowance is to reduce the tax otherwise payable by one third.

There are special depletion allowances for gold and coal mines. The operator of a gold mine may elect to apply a percentage depletion allowance rate of 40 p.c. or an amount of \$4 per ounce of gold produced as a deduction from taxable income. The deduction for coal is 10 cents for each ton of coal mined in the year.

Non-operators are entitled to a depletion allowance of 25 p.c. of their gross income from wells or most mines.

The right of a mining or petroleum company to claim costs of exploration and development incurred in the search for oil, gas or minerals in Canada as immediate deductions from income from all sources is generally regarded as an important tax benefit.

Prospectors and their financial backers are exempt from income tax on receipts from the sale of a mining property acquired as a result of the prospector's efforts, other than rents, royalties or similar payments.

**Emergency Gold Mining Assistance Act.**—Under this Act, which came into force in 1948 (RSC 1970, c. E-5), financial assistance is provided to marginal gold mines to counteract the effects of increasing costs of production and a fixed price for gold. By enabling gold mines to extend their productive life, the subventions help communities dependent on gold mining to adjust gradually to diminishing support. In 1971, the Act was amended and its application extended to June 30, 1973 (SC 1970-71, c. 12). The amendments resulted in the following changes:—

- (1) A gold mine, other than a placer mine, to qualify for cost assistance had to be in reasonable commercial production in the months immediately preceding Aug. 7, 1970.
- (2) A gold mine, that was not a placer mine, was required to agree in writing to: (a) conduct all future hirings through Canada Manpower Centre, (b) give notice of a mine closure at least four months prior to cessation of operations, and (c) retain, immediately following notice of closure, the Manpower Consultative Service of the Department of Manpower and Immigration to assist in the placement of employees as they are laid off.

The amount of assistance payable to an operator is determined by a formula, and is based on the average cost of production per ounce and the number of ounces produced; it ranges from zero to \$10.27 per oz.t. produced. Gold mines having a cost of production of \$26.50 or less per oz.t. receive no assistance and those having a cost of production of \$45 or more per oz.t. receive the maximum rate of \$10.27 per oz.t.

Under the current formula, the assistance payable to the operator of a gold mine is computed by adding 25 p.c. to the product of two factors—the “rate of assistance” and the number of “assistance ounces”. The number of assistance ounces is two thirds of the total ounces produced and sold to the Royal Canadian Mint by a mine in a calendar year. The rate-of-assistance factor is two thirds of the amount by which the average cost of production exceeds \$26.50. The rate-of-assistance factor is limited to a maximum of \$12.33 which is reached when the average cost of production rises to \$45 per oz.t. of gold produced. The average cost of production is determined by dividing the total allowable costs by the total number of ounces produced in the form of bullion from the mine in a calendar year. Only those ounces of gold that have been sold to the Royal Canadian Mint are eligible for inclusion in the assistance-ounces factor. The cost of production includes mining, milling, smelting, refining, transportation and administration costs. Allowances are made for depreciation, pre-production costs and expenditures on exploration and development on the mine property in accordance with the Regulations.

The amounts paid to operators of gold mines, to Mar. 31, 1971 for the years 1948-70, inclusive, totalled \$288,592,320 on a production of 60,240,260 oz.t. of gold produced and sold in accordance with requirements of the Act. The assistance payable for gold produced

and sold under the Act in the calendar year 1970 was estimated to be \$13,000,000. The average Mint price for gold in Canadian funds was \$37.69 an oz.t. during 1969 but was only \$36.57 in 1970.

In March 1968, the governors of the central banks of seven nations introduced a two-price system for gold which separated transactions in gold among the central banks from private open-market operations. The governors agreed that the existing official reserves would be used only in transfers among monetary authorities at the established price of \$35 (U.S.) an ounce, and that the central banks would neither purchase nor sell gold in private gold markets. The Minister of Finance stated that Canada would support fully the agreements reached by the central bankers. He also stated that there would be no change in the practices applicable to gold producers under the Emergency Gold Mining Assistance Act.

Operators of gold mines were thus offered the alternatives of selling their production to the Royal Canadian Mint at the fixed price of \$35 an oz.t. in United States funds in order to qualify for assistance payments under the Emergency Gold Mining Assistance Act or of selling on the open market at the price determined by supply and demand. It may be noted that the amount of assistance payable is determined on the basis of the cost of production and is not related to the selling price of the gold.

In accordance with the agreement by the central bankers, gold purchased by the Mint is not added to Canada's official reserves but is sold on the open market. The open market price exceeded \$35 (U.S.) from April 1968 to the end of 1969, established a year low of \$34.75 (U.S.) in January 1970, but exceeded \$41 (U.S.) in May. Because only gold mine operators receiving assistance sold their gold to the Mint, the cost of assistance under the Act was effectively reduced by the difference in price at which the Mint bought newly mined gold and the price for which it was sold to open market bidders during this period.

### Subsection 2.—Provincial Government Aid\*

**Newfoundland.**—The Newfoundland Government, through the Mines Branch of the Department of Mines, Agriculture and Resources, provides several valuable services to those interested or involved in exploration and mining, including: the conduct of a continuing program of mineral assessment designed to encourage development of the mineral resources of the province; the inspection of exploration work carried out on concession areas and the examination of mining operations; the administration of beaches (control of removal of sand and gravel as a conservation measure) and the collection of data relevant to the control of sand removal; the identification of mineral rock specimens submitted by the public and the examination of corresponding occurrences where such is warranted; the dispensing of technical advice, in so far as possible, to those who seek such service (i.e., in hydrological problems and on the availability of quarriable peat moss to be removed by permit); co-operation with the Geological Survey of Canada and other Federal Government agencies; and the preparation and publication of data useful for educational and general informational purposes, including the preparation of mineral and rock sample sets. Geological reports, geophysical maps and compilations of general data pertaining to specific areas are procurable at nominal cost and other information from unclassified files is made available to interested parties. Prospector's or miner's permits are issued by the Mines Branch and mining claims are recorded.

**Nova Scotia.**—Under the provisions of the Mines Act (RSNS 1967, c. 185), the Government of Nova Scotia may assist a mining company or operator in the sinking of shafts, slopes, deeps and winzes and the driving of adits, tunnels, crosscuts, raises and levels. This assistance may take the form of work performed under contract, the payment of bills for materials and labour, or the guarantee of bank loans. Any such work must be approved by the Department of Mines. Mining machinery and equipment to be used in

\* Revised by the respective provincial governments.

searching for or testing and mining minerals may be made available through the Government. Such equipment is under the direct supervision of the Chief Mining Engineer.

The Government of Nova Scotia is also empowered to make any regulations considered necessary for increasing the output of coal. Such regulations cover the appropriation, on payment, of unworked coal lands, the operation of coal mines, and loans or guarantees for loans. Close co-operation is maintained with the Federal Government in carrying out federal regulations made to secure increased production and economical distribution of coal from the mines of the province.

**New Brunswick.**—The Mines Division of the Department of Natural Resources has two Branches. The Mineral Resources Branch administers the disposition of Crown mineral rights including the issuing of prospecting licences, recording of mining claims, issuing of mining licences and leases and other matters pertaining thereto. Detailed and index claim maps are prepared for distribution. The Branch is responsible for general and detailed geological mapping and investigations. Maps and reports are prepared for distribution, mineral and rock specimens are examined for prospectors and preliminary examinations of mineral prospects are made when requested and circumstances warrant. The Mines Branch administers the safety regulations governing the operations under the Mining Act. All mines are regularly inspected, laboratory facilities are maintained and certain equipment used in mines must be approved. The Branch is responsible also for the collection of mining taxes and royalties and the preparation of statistics on mineral production. A Regional Office, located at Bathurst and staffed by geologists and inspectors, serves as a recording office for northeastern New Brunswick, and another at St. George, staffed by a senior geologist, conducts regional work and assists exploration companies and prospectors working in the southwestern area. Claim maps and topographical, geological and aeromagnetic maps are available for perusal and distribution.

**Quebec.**—Through its Director General of Mines, the Department of Natural Resources is responsible for implementing the Mining Act (SQ 1965, c. 34) and the Mining Duties Act (SQ 1965, c. 35). The directorate includes the following three branches: Geological Services, Mining Service and the Mining Research Centre, as well as the Taxation, Mining Conflicts and Registry Divisions.

The *Geological Services Branch* is concerned with geological exploration, mineral deposits, mapping and hydrogeology. It conducts studies on the geological composition of Quebec territory for the development of mineral resources; following yearly expeditions, detailed reports of the findings and geological maps of different regions are made available for the use of interested persons. The Hydrogeology Section conducts studies on and maintains an inventory of underground water. The Gas and Oil Section collects and compiles technical information for the use of private companies seeking hydrocarbons.

The *Mining Service Branch*, consisting of a Mines Service, an Inspection Service and an Engineering Service, controls mining concession grants on Crown lands, including claims registrations, developmental work permits and special permits for the sale or rental of lands for mining development. It ensures that holders of mining rights live up to the conditions of their agreements and inspectors ensure that work in mines, in quarries and in treatment plants is carried out in accordance with safety law and regulations. The Branch undertakes the engineering studies required prior to opening up a new mining district or operation, including the construction of access roads, the building of mining camps or townsites and any regulations pertaining to the use of the land in question.

The function of the *Mining Research Centre* is to assist those interested in prospecting, mining operations or ore treatment by providing technical and scientific services. In addition to chemical, physical, mineralogical and petrographic analyses, the Centre conducts applied research, principally mineralogical, to promote the development of new deposits in Quebec and to assist in the technological advancement of mines and quarries already in operation.

The Taxation Division levies duties on mining operations as stipulated in the Mining Duties Act and the Mining Conflicts Division verifies the existence or the validity of claims as provided for in Part VI of the Mining Act.

To provide for the future development of the mining industry, scholarships are granted to students wishing to follow a career in geology, mining and metallurgical engineering, as well as to students in hydrology or other relevant fields of science (hydro-electricity, hydraulics or meteorology). The Department makes a conscious effort to initiate young students at the secondary or junior college levels into the mining and geological sciences by seconding staff members to camps for young scientists to interest them in these disciplines.

**Ontario.**—The Ontario Department of Mines and Northern Affairs renders a multiplicity of services of direct assistance to the mining industry within the province. The *Geological Branch* carries on a continuing program of geological mapping and investigations and prepares, for the use of the public, detailed reports and maps of the areas studied. In many active areas of the province, resident geologists gather and make available to the public information concerning geological conditions, exploration and development within their respective districts. Geologists specializing in industrial minerals investigate methods of treatment and recovery of such minerals and compile data on the uses, specifications and markets for such products. During the winter months, courses of instruction for prospectors are held in various centres throughout the province.

The *Laboratory Branch* provides assay and analytical services and conducts mineralogical investigations to aid in the discovery and development of mineral deposits. Its services are available to the mining industry and the public at large. The Temiskaming Testing Laboratory, situated at Cobalt, operates a bulk sampling plant and assay laboratory to assist the producers of the area in marketing their silver-cobalt ores.

The *Mining Lands Branch* handles all matters dealing with the recording of mining claims, assessment work, etc., and the preparation of title to mining lands. As a service to the mining public, individual township maps are prepared and kept up to date, showing lands open for staking and recorded and patented claims therein. District Mining Recorders maintain offices at strategic locations throughout the province.

The *Inspection Branch* administers the operating rules of the Mining Act which call for the regular examination of all operating mines, quarries, sand and gravel pits and certain metallurgical works with a view to ensuring proper conditions of health and safety to the men employed. District offices to serve the local areas are maintained in the major mining centres of the province. Mine rescue stations in the principal mining sections are operated under the supervision of the Branch and all hoisting ropes in use at mines are periodically tested by a Branch-operated cable-testing laboratory.

The *Finance and Administration Branch* includes an Information Section which carries out a regular publicity and information program and maintains a library of films on mining subjects which are available for free loan to the public. Each year, displays pertaining to mining are prepared and presented at exhibitions throughout the province. A new section has recently been set up within the Branch consisting of two economists and a statistician, the function of which is to provide projections of Ontario's mineral economy for the industry. The Publications Office of the Branch is responsible for distribution of all departmental literature and maps.

Since 1951 the Department has been engaged in a road-building program to give access to mineralized areas and open them for full development. In 1955 this became an inter-departmental project with other interested departments participating through an inter-departmental committee of Ministers which decides on priorities and locations. Actual construction is carried out by the Department of Highways.

The *Northern Affairs Branch* has a function that is unique in government. In effect, it serves as liaison between the people of northern Ontario and the government and its various branches in Toronto. Such a link was found to be necessary because of the distance

separating many parts of the north and the seat of government. The Branch, with headquarters in Toronto, regional offices at Sudbury, Timmins and Thunder Bay and 25 Northern Affairs offices strategically located throughout the North as well as a number of satellite offices, provides instant communication among the offices through which government-oriented problems of northerners can usually be resolved quickly and easily by direct communication with the department and branch concerned.

**Manitoba.**—The Mines Branch of the Manitoba Department of Mines, Resources and Environmental Management offers five main services to assist the mineral industries: maintenance of records and field inspections required for the granting and retention of titles to mineral locations; compilation of geological data pertinent to mineral occurrences, and recording of new information by geological mapping; environmental control relevant to mining and quarrying operations, enforcement of mine safety regulations, training of mine rescue crews and promotion of improvements in underground working conditions; environmental control relevant to the drilling, abandonment and reworking of oil wells, and maintenance of technical records of all exploration and production wells; and operation of a chemical and assay laboratory to assist prospectors and geologists in the evaluation of mineral occurrences and the classification of rocks and minerals. The Mineral Exploration Assistance Act (1966) provides for limited financial grants to prospectors who have carried out previously agreed exploration programs at specified locations; such grants are repayable if the program leads to a profitable mining operation.

**Saskatchewan.**—The *Mineral Lands Branch* of the Department of Mineral Resources is responsible for making disposition of all Crown minerals and maintains records respecting areas let out by lease, permit or claim. Recording offices, located at Regina, La Ronge, Uranium City and Creighton, assist the public in determining the lands available and accept applications.

Officers of the *Mines Inspection Branch*, under the authority of the Mines Regulation Act, make regular examinations of all mines to ensure proper conditions for the health and safety of the men employed. Safety education, particularly in the form of first aid and mine rescue instruction, is also a part of the work of this Branch. All Branch officers are stationed at the Regina headquarters.

The Precambrian Geology Division of the *Geological Sciences Branch* conducts geological surveys in the shield areas of the province and publishes maps and reports for the information and guidance of the industry. Resident geologists are maintained at Uranium City and La Ronge and at the latter centre a laboratory provides for the storage and examination of core and samples. The Division processes exploration data and assessment work to be made available for inspection by the industry.

**Alberta.**—Alberta Government assistance to the mining industry is diversified in character. The Mines Division of the Department of Mines and Minerals regulates coal mines and quarries and maintains standards of safety by inspection and certification of workers. The Workmen's Compensation Board also maintains safety standards and pays the cost of training mine rescue crews. The oil and gas industries are served in a similar way by the Energy Resources Conservation Board. Its regulatory measures, however, are also concerned with preventing the waste of oil and gas resources and with giving each owner of oil and gas rights the opportunity of obtaining a fair share of production. This Board compiles periodic reports and annual records which are of invaluable assistance in oil development in Alberta. The mining industry is also served by the Research Council of Alberta which has made geological surveys of most of the province and has carried forward projects concerned with the uses and development of minerals. The Council has studied the occurrence, uses and analyses of Alberta coals and their particular chemical and physical properties, the use of coals in the generation of power, and the upgrading and cleaning of coal, and has also studied briquetting, blending, abrasion loss, shatter and crushing strength,

asphalt binders and dust-proofing of coal. Studies have been made of glass sands, salt, fertilizers, cement manufacture and brick and tile manufacture. (See also p. 472.)

The province from time to time has had commissions examine various aspects of the mining industry when it has considered that their findings would be of assistance in developing such industries. The province, together with the Canadian Association of Oil Well Drilling Contractors and the Canadian Petroleum Association, maintains a detailed supervisory and safety training program concerned with the drilling of oil and gas wells. Of assistance also to mining companies and oil companies are the special reductions provided for in the Alberta Income Tax Act. These follow the parallel provisions in the federal Income Tax Act.

**British Columbia.**—The Department of Mines and Petroleum Resources of British Columbia provides the following services: detailed geological mapping as a supplement to the work of the Geological Survey of Canada; assistance to the prospector in the field by departmental engineers and geologists; grub-stakes, limited to a maximum of \$800, for prospectors; assistance in the construction of mining roads and trails; and inspection of mines to ensure safe operating conditions.

### Section 3.—Mining and Petroleum Legislation

**Federal and Departmental Jurisdictions.**—Mineral rights vested in the Crown in right of Canada include those situated in the Yukon and Northwest Territories and offshore underlying Canada's continental margins, as well as those underlying certain federally owned lands within the provinces.

The Supreme Court of Canada in its Opinion of November 1967 stated that, as between Canada and the Province of British Columbia, Canada has proprietary rights in and legislative jurisdiction over "lands, including the mineral and other natural resources, of the sea bed and subsoil seaward from the ordinary low-water mark on the coast of the mainland and the several islands of British Columbia, outside the harbours, bays, estuaries and other similar inland waters, to the outer limit of the territorial sea of Canada, as defined in the Territorial Sea and Fishing Zones Act...". The Court also stated that the Federal Government has legislative jurisdiction "in respect of the mineral and other natural resources of the sea bed and subsoil beyond that part of the territorial sea of Canada... to a depth of 200 meters or, beyond that limit, to where the depth of the superjacent waters admits of the exploitation of the mineral and other natural resources of the said areas...".

The Department of Energy, Mines and Resources, through the Resource Management and Conservation Branch, is responsible for the administration and enforcement of legislation and regulations relating to mineral resources offshore from Canada's East and West Coasts and in the Hudson Bay and Hudson Strait regions, as well as with respect to the federally owned mineral rights in the provinces mentioned above. The Department of Indian Affairs and Northern Development, through the Northern Economic Development Branch, is similarly responsible concerning mineral rights in the Yukon and Northwest Territories and underlying Canada's high-Arctic offshore regions.

Mineral rights of Indian reserves in the provinces are also vested in the Crown in the right of Canada and are administered by the Indian-Eskimo Economic Development Branch of the Department of Indian Affairs and Northern Development. The rights to a reserve may be taken up only after the Indian band has given approval for development through a referendum vote. The minerals are then administered under the Indian Oil and Gas Regulations or the Indian Mining Regulations, except in British Columbia where mining rights must be acquired under provincial statutes and the B.C. Indian Reserves Mineral Resources Agreement of 1943. The Indian Oil and Gas Regulations provide for disposal of rights by public tender in the form of permit or lease parcels. The Indian Mining Regulations, on the other hand, provide for disposal based on terms negotiated with the Indian band council. In this manner the Indian councils are assuming a greater

share of responsibility in the management of their mineral resources. Officers of the Department of Indian Affairs and Northern Development are advisers to the Indian councils on mineral matters and are responsible for the administration and enforcement of relevant regulations.

**Federal Mining Laws and Regulations.**—Mining exploration is carried out in the Yukon Territory in accordance with the provisions of the Yukon Quartz Mining Act and the Yukon Placer Mining Act; in the Northwest Territories, including Arctic coastal waters, operations are governed by the Canada Mining Regulations 1961, as amended. There are also the Territorial Dredging Regulations, Territorial Coal Regulations and Territorial Quarrying Regulations common to both territories. In the Yukon Territory, mining rights may be acquired by staking claims under the appropriate Acts and Regulations. A one-year lease may be obtained to prospect for the purposes of placer mining, renewable for two additional periods of one year each; a 21-year lease, renewable for a like period, may be obtained under the Yukon Quartz Mining Act.

Under the Canada Mining Regulations, a prospector's licence is required. Staked claims must be converted to lease or relinquished within 10 years. In certain areas, a system of exploration by permit over large areas is allowed. Any individual over 18 years of age or any joint-stock company incorporated or licensed to do business in Canada may hold a prospector's licence. No lease will be granted to an individual unless the Minister of the Department involved is satisfied that the applicant is a Canadian citizen and will be the beneficial owner of any interest acquired under such lease; no lease will be granted to a corporation unless such corporation is incorporated in Canada and unless the Minister is satisfied that at least 50 p.c. of the issued shares of the corporation are owned by Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange and that Canadians will have the opportunity of participating in the financing and ownership of the corporation. Any new mine beginning production after the Canada Mining Regulations came into force in 1961 will not be required to pay royalties for a period of 36 months, starting from the day the mine comes into production. Production date is established as the date determined under the provisions of the Income Tax Act.

An exploration assistance fund for petroleum and other minerals in the Yukon and Northwest Territories was established by the Federal Government in 1966. Initially limited to \$3,000,000 a year, the fund may provide 40 p.c. of the cost of approved exploration programs. Assistance is available only to Canadian citizens or companies incorporated in Canada. Named the Northern Mineral Exploration Program, it is designed to encourage investment from additional Canadian sources previously not attracted to investment in northern exploration operations.

**Oil and Gas Legislation.**—Oil and gas exploration and development in the Yukon and Northwest Territories and Canadian offshore areas are governed by the Territorial Lands Act, the Public Lands Grants Act, the Oil and Gas Production and Conservation Act and regulations pursuant thereto. Both the Canada Oil and Gas Land Regulations and the Oil and Gas Drilling and Production Regulations were under review in late 1971. The former regulations are being amended; the latter regulations may be amended with respect to 'onland' areas, but new operational and conservation regulations are being drafted for the 'offshore', pursuant to the Oil and Gas Production and Conservation Act.

An oil and gas exploration permit may be granted either upon application, or, in respect of land previously held under permit, by sale through public tender for three, four or six years, depending upon latitude and region. A permit is renewable for up to six one-year periods, with provisions that the appropriate Minister may grant additional renewals under special terms and conditions. The permittee is obligated to undertake exploratory work in an amount no less than 5 cents per acre for the first 18 to 36 months increasing to 15 to 20 cents per acre for subsequent periods of the primary term. Work obligations for each one-year renewal period increase up to 50 cents per acre. The permittee must post a

guarantee deposit in the form of cash, bonds, or promissory notes prior to each work period. These deposits are returned upon receipt of satisfactory evidence that exploratory work has been performed, and are forfeited to the Crown in the event the permittee fails to fulfil the work obligations. Oil and gas leases may be selected in accordance with prescribed guidelines for up to 50 p.c. of a permit area, with that portion not converted to lease reverting to the Crown.

An oil and gas exploration permit may be issued to any individual over 21 years of age or to any joint-stock company incorporated or licensed to do business in Canada, or incorporated in any province of Canada. Extra-territorial companies applying for permits in the Northwest Territories must be registered under the Companies Ordinance of the Northwest Territories. An oil and gas lease may be granted to a permittee where the Minister of the Department involved is satisfied that the applicant is a Canadian citizen over 21 years of age and will be the beneficial owner of the interest granted, or to a corporation where such corporation is incorporated in Canada, and where the Minister is satisfied that at least 50 p.c. of the issued shares of the corporation are beneficially owned by Canadian citizens or that the shares of the corporation are listed on a recognized Canadian stock exchange and that Canadians will have an opportunity of participating in the financing and ownership of the corporation, or the operation is wholly owned by a corporation that meets either of these two requirements.

The Oil and Gas Production and Conservation Act provides for comprehensive control over all oil and gas operations in the Territories and offshore regions including such matters as safety, the prevention of waste and pollution, production, conservation, storage, transmission, and unitization of oil and gas fields. An Oil and Gas Committee of five members appointed by the Governor in Council is empowered to hold enquiries, to hear appeals, and to make orders in connection therewith.

Federally owned mineral rights within the provinces that are available for development (except those in Indian lands) are administered by the Department of Energy, Mines and Resources under regulations promulgated pursuant to the Public Lands Grants Act.

**Provincial Mining Laws and Regulations.**\*—In general, all Crown mineral lands lying within the boundaries of the several provinces (with the exception of those within Indian reserves, national parks and other lands which are under the jurisdiction of the Federal Government) are administered by the respective provincial governments. The exception is Quebec where all mineral lands except those granted to individuals in the townships prior to 1880 are administered by the province; also, mining rights on federal lands in Quebec are administered by the province.

The granting of land in any province except Ontario no longer automatically carries with it mining rights upon or under such land. In Ontario, mineral rights are expressly reserved if they are not to be included. In Nova Scotia, no mineral rights belong to the owner of the land except those pertaining to gypsum, agricultural limestone and building materials, and the Lieutenant-Governor in Council may declare deposits of either limestone or building materials to be minerals. Such declaration is to be based on economic value or to serve the public interest. In such case, the initial privilege of acquiring the declared minerals lies with the owner of the surface rights who must then conform with the requirements of the Mines Act. In Newfoundland, mineral and quarry rights are expressly reserved. Some early grants in British Columbia, Alberta, Saskatchewan, Manitoba, New Brunswick, Quebec and Newfoundland also included certain mineral rights. Otherwise, mining rights must be obtained separately by lease or grant from the provincial authority administering the mining laws and regulations. Mining activities may be classified as placer, general minerals (or veined minerals and bedded minerals), fuels (coal, petroleum and gas) and quarrying. Provincial mining regulations under these divisions are summarized in the following paragraphs.

\* Approved by the respective provincial governments.

*Placer.*—In most provinces in which placer deposits occur there are regulations defining the size of placer holdings, the terms under which they may be acquired and held, and the royalties to be paid.

*General Minerals.*—These minerals are sometimes described as quartz, lode, or minerals in place. With the exception of British Columbia, the most elaborate laws and regulations apply in this division. In all provinces except Alberta and Saskatchewan, a prospector's or miner's licence, valid for one year, must be obtained to search for mineral deposits, the licence being general in some areas but limited in others; a claim of promising ground of a specified size may then be staked. In Manitoba and British Columbia a licence is required only for staking and any number of dispositions may be staked under one licence. A claim must be recorded within a time limit and payment of recording fees made, except in Quebec where no fees are required. Work to a specified value per annum must be performed upon the claim for a period of up to ten years except in Quebec where a development licence may be renewed on a yearly basis; also in Manitoba and Saskatchewan there is no work commitment in the first year of the claim. There is no time limit in British Columbia but \$500 assessment work, of which a survey may represent two fifths, must be performed and recorded before a lease may be obtained. In Quebec, a specified number of man-hours of work must be performed and the excess may be carried forward for renewal of licence. The taxation applied most frequently is a percentage of net profits of producing mines or royalties. In Saskatchewan, subsurface mineral regulations covering non-metallics stipulate the size and type of dispositions that may be made in order to maintain the disposition in good standing, provide for fees, rentals and royalties, and set out generally the rights and obligations of the disposition holder.

*Fuels.*—In provinces where coal occurs, the size of holdings is laid down together with the conditions of work and rental under which they may be held. In Quebec, the search for and development of petroleum and natural gas may be carried out under a prospecting or search permit followed by a working lease; the search permit covers a period of five years and an acreage of not over 60,000 acres, whereas the lease extends over a 20-year period and an acreage not over half the acreage of the permit. In Nova Scotia, mining rights to certain minerals, including petroleum, occurring under differing conditions may be held by different licensees. Provision is sometimes made for royalties. Acts or regulations govern methods of production. In the search for petroleum and natural gas, an exploration permit or reservation is usually required; however, in Manitoba, Saskatchewan, Alberta and British Columbia leases usually follow the exploration reservation whether or not any discovery of oil or gas is made. In Alberta, exploration costs are applicable in part on the first year's lease rental, in Manitoba they may be applied to the lease rental for a period of up to three years and, in British Columbia and Saskatchewan, credit is given for up to 24 months' rental, having regard to the amount of excess credit established. In other provinces, the discovery of oil or gas is usually prerequisite to obtaining a lease or grant of a limited area, subject to carrying out drilling obligations and paying a rental, a fee, or a royalty on production.

*Quarrying.*—Regulations under this heading define the size of holdings and the terms of lease or grant. In Nova Scotia, sand deposits of a quality suitable for uses other than building purposes and limestone deposits of metallurgical grade belong to the Crown; gypsum quarries belong to the owner of the property. Under the New Brunswick Quarriable Substances Act, 1968, quarriable substances (ordinary stone, building and construction stone, sand, gravel, peat and peat moss) are vested in the owner of the land in or on which they lie; the Minister with the approval of the Lieutenant-Governor in Council may designate a shore area lying outside Crown land to be subject to the Act; and no person shall take or remove or cause to be taken or removed more than one half cubic yard of a quarriable substance from Crown land or a designated shore area without obtaining a permit or lease. On Quebec public lands and on those granted to individuals after Jan. 1, 1966, the stone, sand and gravel, like other building materials, belong to the Crown; quarries

located on land granted to individuals prior to 1966 remain in the possession of the owners of the surface; the right to exploit all building materials except sand and gravel may be acquired by ordinary staking-out and the right to work sand and gravel beds is set by regulation. In Saskatchewan, sand and gravel on the surface and all sand and gravel obtainable by stripping off the overburden or other surface operation belong to the owner of the surface of the land. In Alberta, sand, gravel, clay and marl recovered by excavating from the surface belong to the owner of the surface of the land.

Copies of mining legislation including regulations and other details may be obtained from the provincial authorities concerned.

### Section 4.—World Production of Certain Metallic Minerals and Fuels

Table 33 shows the production of certain metallic minerals and fuels in the different countries of the world for the year 1969. These figures are taken from the *United Nations Statistical Yearbook 1970* which presents production figures for a much more extensive list of mining and quarrying industries.

#### 33.—World Production of Certain Metallic Minerals and Fuels, 1969

NOTE.—Where dashes occur throughout this table they indicate that no figures were given in the *United Nations Statistical Yearbook* either because there was no production or because the quantity was not available.

*The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.*

## PART I.—FORESTRY\*

Canada's extensive forests have been an invaluable asset to the country and its people since the earliest days of settlement. The productive portion of these forests has poured increasing wealth into the stream of national income, contributing to the economy of the country as the producer of raw materials for industry and as the source of livelihood for hundreds of thousands of persons. Perhaps in no other country is the national wealth so dependent upon its forest resources and the success of its forest industries as in Canada.

The 1969 forest harvest of some 4,304,000,000 cu. feet of roundwood supports a highly complex and diversified domestic and export industry. The forest industries (which include the logging industry, the wood industries and the paper and allied industries) provide about 265,000 man-years of employment and pay out more than \$1,808,000,000 annually in salaries and wages. In addition, a considerable number of people derive part of their income from farm woodlot operations, etc. The forests support a large number of sawmills and wood-using plants which in many cases are located in small towns and villages and contribute appreciably to the local economies. The sale of forest products abroad represents about one fifth of the value of Canada's export trade.

The predominant part played by the pulp and paper, lumber, and other forest products industries in the development of the country has, in the past, resulted in a widespread

\* Sections of this Part that deal with forest resources and depletion and the federal forestry program were revised by the Canadian Forestry Service of the Department of the Environment, Ottawa. Provincial forestry programs were prepared by the forestry officials of the respective provincial governments. Sections dealing with forest and allied industries, except as otherwise noted, were revised in the Forestry Section, Manufacturing and Primary Industries Division, Statistics Canada.

tendency to evaluate the forest in terms of timber alone. There is now a growing realization of the value of the forest in assuring an adequate supply of good-quality water, in providing for sport and recreation, in guarding against erosion, and in maintaining a habitat for wildlife. The increasing recognition of these forest values is fostering a broader and more realistic concept of forestry.

The Canadian forest industry as a whole recorded a substantial increase in productivity over the years 1961-69 inclusive, the total estimated "value added" (value of shipments less cost of materials and fuel) advancing from \$2,000,000,000 to \$3,400,000,000 in 1969.

During the period, roundwood production moved up 36 p.c. from 3,175,000,000 to 4,304,000,000 cu. feet. The increase was more than accounted for by roundwood produced for industrial purposes, since that produced for non-industrial purposes, such as fuelwood and wood for charcoal, declined. Lumber shipments rose from about 8,216,000 to 11,000,000 M ft. b.m. In 1969, British Columbia sawmills accounted for about 69 p.c. of all shipments of lumber in Canada and more than 70 p.c. of it was exported, mainly to the United States. The production of wood pulp also rose substantially, increasing 55 p.c. to nearly 18,600,000 tons in 1969. Although the most important component of this total continued to be groundwood pulp, 8,030,000 tons of which were produced primarily in Ontario, Quebec and the Atlantic Provinces, output of sulphate pulp increased by 157 p.c. over the period to 6,950,000 tons. British Columbia produced most of the sulphate pulp and it was in British Columbia, too, that the largest part of the increase in pulp output occurred. Pulp exports over the period increased from 24 p.c. to 31 p.c. of total production, about 70 p.c. going to the United States.

Production of basic paper and paperboard also rose over the 1961-69 period, increasing 41 p.c. to reach 12,093,000 tons. About 71 p.c. of the 1969 total came from Ontario and Quebec and 15 p.c. from British Columbia. Newsprint, made chiefly in Ontario and Quebec, is the most important paper commodity manufactured in Canada, followed in order by paperboard and book and writing papers. In 1969, pulp and paper exports made up 14 p.c. of the value of all Canadian exports and, once again, the United States was the principal market for these commodities.

The value of factory shipments from veneer and plywood mills was 110 p.c. higher in 1969 than in 1961. In the earlier year, about 60 p.c. of the value of output (\$129,300,000) was accounted for by British Columbia Douglas-fir veneer and plywood but by 1969 this proportion had dropped to 48 p.c. On the other hand, plywood manufactured from other British Columbia softwoods increased. Hardwood veneer and plywood made primarily in Ontario and Quebec from poplar, birch and maple accounted for 36 p.c. of the value of all factory shipments in 1961 and for 29 p.c. in 1969. Of the total value of exports of veneer and plywood, amounting to \$80,000,000 in 1969, Douglas-fir plywood accounted for over \$43,000,000, about 70 p.c. of it going to Britain.

## Section 1.—Forest Resources

**Forest Regions.\***—The forests of Canada cover a vast area in the north temperate climatic zone but wide variations in physiographic, soil and climatic conditions cause marked differences in their character; hence, eight fairly well-defined forest regions may be recognized. These regions and their relative sizes are as follows:—

<i>Region</i>	<i>Percentage of Forest Area</i>	<i>Region</i>	<i>Percentage of Forest Area</i>
Boreal.....	82.1	Acadian.....	2.0
Great Lakes-St. Lawrence..	6.5	Columbia.....	0.8
Subalpine.....	3.7	Deciduous.....	0.4
Montane.....	2.3		
Coast.....	2.2	TOTAL.....	100.0

\* A more detailed discussion of forest regions is given in Bulletin 123, *Forest Regions of Canada*, published by the Canadian Forestry Service, Department of the Environment, Ottawa.

*Boreal Forest Region.*—This Region comprises the greater part of the forested area of Canada. It forms a continuous belt from Newfoundland and the Labrador coast westward to the Rocky Mountains and northwestward to Alaska. White Spruce and Black Spruce are characteristic species; other prominent conifers are Tamarack which generally ranges throughout, Balsam Fir and Jack Pine in the eastern and central portions, and Alpine Fir and Lodgepole Pine in the western and northwestern parts. Although the Boreal forests are primarily coniferous, there is a general admixture of deciduous trees such as White Birch and poplar; these are important in the central and south-central portions, particularly along the edge of the prairie. In turn, the proportion of spruce and larch increases to the north and, with the more rigorous climate, the close forest gives way to an open lichen-woodland which finally changes into tundra. In the eastern section, along the southern border of the Region, there is a considerable intermixture of species from the Great Lakes—St. Lawrence forest, such as Eastern White Pine, Red Pine, Yellow Birch, Sugar Maple, Black Ash and Eastern White Cedar.

*Great Lakes—St. Lawrence Forest Region.*—Extending inland from the edges of the Great Lakes and the St. Lawrence River lies a forest of a very mixed nature which is characterized by Eastern White Pine, Red Pine, Eastern Hemlock and Yellow Birch. With these are associated certain dominant broadleaved species common to the Deciduous Forest Region, including Sugar Maple, Red Maple, Red Oak, Basswood and White Elm. Other species with wide ranges are the Eastern White Cedar and Largetooth Aspen and, to a lesser extent, Beech, White Oak, Butternut and White Ash. Boreal species such as White Spruce, Black Spruce, Balsam Fir, Jack Pine, poplars, and White Birch are intermixed, and Red Spruce is abundant in certain central and eastern portions. This Region extends in a westward direction into southeastern Manitoba but does not include the area north of Lake Superior.

*Subalpine Forest Region.*—This is a coniferous forest located on the mountain uplands of Alberta and British Columbia, from the Rocky Mountain range through the interior of British Columbia to the Pacific Coast inlets. The characteristic species are Engelmann Spruce, Alpine Fir and Lodgepole Pine. There is a close relationship between the Subalpine Forest Region and the Boreal Forest Region, which also shares Black Spruce, White Spruce and Trembling Aspen. There is also some penetration of Interior Douglas-fir from the Montane forest, and Western Hemlock, Western Red Cedar and Amabilis Fir from the coastal forests. Other species are Western Larch, Whitebark Pine, Limber Pine and, on the Coast Mountains, Yellow Cypress and Mountain Hemlock.

*Montane Forest Region.*—The Region occupies a large part of the interior uplands of British Columbia, as well as a part of the Kootenay Valley and a small area on the east side of the Rocky Mountains. It is a northern extension of the typical forest of much of the western mountain system in the United States, and comes in contact with the Coast, Columbia, and Subalpine Forest Regions. Ponderosa Pine is a characteristic species of the southern portions. Interior Douglas-fir is found throughout, but more particularly in the central and southern parts; Lodgepole Pine and Trembling Aspen are generally present, the latter being particularly well represented in the north-central portions. Englemann Spruce and Alpine Fir from the Subalpine Forest Region, together with White Birch, are important constituents in the northern parts. White Spruce, although primarily Boreal in affinity, also grows here. Extensive prairie communities of bunch-grasses and herbs are found in many of the river valleys.

*Coast Forest Region.*—This Region is part of the Pacific Coast forest of North America. Essentially coniferous, it consists principally of Western Red Cedar and Western Hemlock, with Sitka Spruce abundant in the north and Douglas-fir in the south. Amabilis Fir and Yellow Cypress are represented throughout the Region and, together with Mountain Hemlock and Alpine Fir, are common at the higher altitudes. Western White Pine is found in the southern parts, while Western Yew is in widely scattered groups. Deciduous trees, such as Black Cottonwood, Red Alder and Bigleaf Maple, have a limited distribution.

**Sorting logs at Port Alberni, B.C.**

**Turbo Beaver dropping fire retardant.**

**A tree harvester at work in a spruce forest.**

**A wildland tree planter disturbs the soil, thus promoting better survival and growth for the young trees.**

**Ontario Department of  
Lands and Forests**

Arbutus and Garry Oak grow only on the southeast coast of Vancouver Island, the adjacent islands and mainland. The Arbutus is a broadleaved evergreen. Both are species whose centres of population lie southward in the United States.

*Acadian Forest Region.*—Over the greater part of the Maritime Provinces (excluding Newfoundland) there is a forest closely related to the Great Lakes–St. Lawrence forest and, to a lesser extent, to the Boreal forest. Red Spruce is a characteristic though not exclusive species, and associated with it are Balsam Fir, Yellow Birch and Sugar Maple, with some Red Pine, Eastern White Pine and Eastern Hemlock. Beech was formerly a more important forest constituent than at present, but beech bark disease has drastically reduced Beech representation in Nova Scotia, Prince Edward Island and southern New Brunswick. Other species of wide distribution are White Spruce, Black Spruce, Red Oak, White Elm, Black Ash, Red Maple, White Birch, Grey Birch and poplars. Eastern White Cedar, although present in New Brunswick, is extremely rare elsewhere and Jack Pine is apparently absent from the upper St. John Valley and the western half of Nova Scotia.

*Columbia Forest Region.*—A large part of the Kootenay Valley, the upper valleys of the Thompson and Fraser Rivers and the Quesnel Lake area of British Columbia contain a coniferous forest, called the Columbia Forest Region, which closely resembles the Coast Forest Region. Western Red Cedar and Western Hemlock are the characteristic species in this interior “wet belt”. Associated trees are the Interior Douglas-fir which has general distribution and, in the southern parts, Western White Pine, Western Larch, Grand Fir and Western Yew. Engelmann Spruce from the Subalpine Forest Region is important in the upper Fraser Valley and is found to some extent at the upper levels of the forest in the remainder of the Region. At lower elevations in the west and in parts of the Kootenay Valley, the forest merges into the Montane Forest Region and in a few places into prairie grassland.

*Deciduous Forest Region.*—A small portion of the deciduous forest, which is widespread in the United States, extends into southwestern Ontario between Lakes Huron, Erie and Ontario. Here, with the deciduous trees common to the Great Lakes–St. Lawrence Forest Region, such as Sugar Maple, Beech, White Elm, Basswood, Red Ash, White Oak and Butternut, are scattered a number of other deciduous species which have their northern limits in this locality. Among these are the Tulip-tree, Cucumber-tree, Pawpaw, Red Mulberry, Kentucky Coffee-tree, Redbud, Black Gum, Blue Ash, Sassafras, Mockernut Hickory, Pignut Hickory, Black Oak and Pin Oak. In addition, Black Walnut, Sycamore and Swamp White Oak are confined largely to this Region. Conifers are few but there is scattered distribution of Eastern White Pine, Tamarack, Eastern Red Cedar and Eastern Hemlock.

*The Grasslands.*—Although not a forest region, the prairies of Manitoba, Saskatchewan and Alberta support several species of trees in great numbers. Trembling Aspen forms groves or “bluffs” around wet depressions, and continuous dense stands along the northern boundary. Several other species of poplar are usually found along rivers and in moist locations, along with willows and some White Spruce. There are sporadic stands of White Birch, Manitoba Maple, Bur Oak and ash. In British Columbia, where the grasslands are confined to deep valleys and low areas of the interior, there are scattered representations of Ponderosa Pine, birches, poplars, spruce and Mountain Alder.

**Forest Land.**—Inventories of the forest resources of Canada are made periodically by provincial forest authorities and, with their co-operation, the Canadian Forestry Service of the Department of the Environment compiles national statistics.

The 1968 National Forest Inventory reported an area of 1,244,292 sq. miles of forest land. Of this total, 26,616 sq. miles are reserved by legislation for primary uses other than timber production. The remainder is divided into two categories—919,209 sq. miles suitable for regular harvest and 298,467 sq. miles unsuitable, because of slow regeneration and

growth. This second category is nevertheless capable of growing trees of merchantable size and volume to be marketable and also to dominate the vegetative associations. As inventories are extended and refined, the reported area of this category of forest land will no doubt be larger. Currently, only 65 p.c. of the forest land of Canada has been inventoried in the sense of gathering statistically reliable information on area and forest cover.

Table 1 shows the areas of these three categories of forest land by province and territory.

**1.—Forest Land,<sup>1</sup> by Province, according to the 1968 National Forest Inventory**

<sup>1</sup> Land capable of producing stands of trees four inches D.B.H. (diameter at breast height) and larger on 10 p.c. or more of the area; shelterbelts and units of forest of five acres or less and scattered are excluded; does not include agricultural land currently in use, although capable of producing trees as above.

<sup>2</sup> Forest land in parks, game

refuges, water conservation areas and nature preserves where, by legislation, wood production is not primary.

<sup>3</sup> Forest land estimated to have the capability of producing crops at regular intervals. <sup>4</sup> Distinguished from other classifications by observed or estimated productivity where a rotation period of an undetermined length is required to grow a merchantable stand of trees but with potential harvest possibilities; may be considered as an emergency reservoir with no "allowable cut" calculation.

The estimates of the merchantable timber, which are given by province in Table 2, are also subject to constant revision as more accurate and complete inventories are compiled. The volumes reported in the 1968 National Forest Inventory are smaller than those reported previously despite more extensive inventory coverage. This is the result of two factors—first, the 1963 inventory, which was the basis for previously presented information, provided rough estimates of timber volumes in Labrador and in the Yukon and Northwest Territories but, in the absence of reliable data, these areas were not covered in the 1968 inventory; secondly, British Columbia adopted procedures whereby data on volume of mature timber only were compiled.

*Tenure and State of Non-reserved Forest Land.*—Provincial Crown forest land constitutes 69 p.c. of the non-reserved forest land of Canada, leaving 23 p.c. under federal jurisdiction and 8 p.c. in private ownership. Of the provincial forest land, 69 p.c. is allocated to timber production and of the federal forest land less than 2 p.c. is so allocated. Although precise use of private forest land is a matter of speculation, individual studies and limited statistics suggest that timber production still predominates despite a tendency to convert some of this land to recreational use. At the time of the 1968 inventory, 10 p.c. of the non-reserved forest land was considered inadequately stocked for timber production.

**2.—Merchantable Timber, by Type and by Province and Region, 1968**

NOTE.—Data cover merchantable timber on inventoried, non-reserved forest land only, all maturity classes.

**Canada's Forest Trees.**—There are approximately 140 recognized tree species in Canada,\* excluding the various subspecies and varieties. Of this number, 31 species are conifers or 'softwoods', about two thirds of which are of commercial value; less than one fifth of the native broadleaved trees or 'hardwoods' can be considered as commercially significant.

The most abundant forest trees in Canada, in terms of standing timber, are the spruces, pines, true firs, poplars, hemlocks, birches, cedars, Douglas-fir, maples and larches. However, the economic importance of these species, except for the spruces, does not necessarily correspond to their abundance.

About one third of Canada's timber volume is spruce. White Spruce and Black Spruce range from the Atlantic Coast almost to the Pacific and northward into Alaska. Sitka Spruce, the largest of the native spruces, is found in the Pacific Coast area; Engelmann Spruce is established farther inland, extending to the foothills of the Rockies in southwestern Alberta; and Red Spruce is found only in Eastern Canada. Spruce is used extensively for pulpwood, lumber and plywood.

Among the pines, two species—Jack Pine and Lodgepole Pine—comprise 11 p.c. of Canada's standing timber. Jack Pine grows from Nova Scotia to northern Alberta and the Northwest Territories and Lodgepole Pine is found in western Alberta, British Columbia and Yukon Territory. Eastern White Pine, which grows from the Atlantic to the eastern edge of the prairies, and Western White Pine produce valuable softwood lumber. Ponderosa Pine, found in the drier areas of southern British Columbia, and Red Pine, found in Eastern Canada, are important commercial species.

\* See *Native Trees of Canada*—7th Edition, Information Canada, Ottawa, 1969.

The four native firs are all commercial species, although Balsam Fir far outranks the other species in this regard. It is the only fir found in Eastern Canada and ranges from Newfoundland through all the provinces except British Columbia. Alpine Fir, essentially a high altitude tree, is found over a wide area in British Columbia and its range extends well into the western half of central Alberta and the Yukon. Amabilis Fir is a West Coast species, while Grand Fir is found both in the Pacific coastal areas and in the interior of British Columbia. Fir is commonly cut as pulpwood and, to a lesser extent, as sawlogs.

Douglas-fir, one of Canada's best known commercial trees, is not a true fir. The tree responsible more than any other for British Columbia's world-wide reputation for timber is the coastal form of Douglas-fir which is dominant in the forests of the province's lower coastal areas. An interior form, known as Blue Douglas-fir, is used on a large scale for lumber, plywood, construction timbers, piling and kraft pulp.

The poplars are the most abundant of the native broadleaved trees. They include Trembling and Largetooth Aspen, Balsam Poplar, and the three cottonwoods. The most widely distributed is Trembling Aspen, followed by Balsam Poplar; both species occur from Newfoundland to Alaska. The largest of the native poplars is Black Cottonwood; its range covers the lower two thirds of British Columbia and extends well into Alberta to the east in a pattern that follows the natural drainage basins. It also reaches as far north as the Yukon along the coast. This species is in demand for veneer stock. Other cottonwoods—Eastern Cottonwood and its western form known as Plains Cottonwood, and Narrowleaf Cottonwood—have a much narrower distribution.

Hemlocks, ranking fifth in volume of standing timber, have considerable commercial importance. Western Hemlock grows plentifully along the Pacific Coast and west of the Rockies in the interior wet belt of British Columbia. It is one of the principal timber-producing species in Western Canada and is also an important source of pulpwood. Eastern Hemlock is found from the Atlantic to western Ontario, although not in a wide or continuous pattern. It is used to produce a number of products including pulpwood, plywood and lumber. Mountain Hemlock is found in British Columbia in parts of the coastal forest and in the heavier rainfall areas of the interior.

Of the six native birches, only two are of commercial importance—Yellow Birch and White Birch. Most abundant is White Birch which grows over a vast part of Canada from the Atlantic to the Pacific and extends up to the northern tree limit. One variety, Western Paper Birch, reaches heights of 100 feet and diameters of three feet or more. Yellow Birch is a valuable hardwood species used extensively for flooring, veneer and plywood. Its range extends from the Atlantic to Lake Superior.

The native trees commonly known as 'cedars' include the Arbor-Vitae (Eastern White Cedar and Western Red Cedar), Yellow Cypress (Yellow Cedar) and a juniper (Eastern Red Cedar). Together they make up an important group of commercial species. Eastern White Cedar is found from Nova Scotia to Manitoba and as far north as James Bay in Quebec and Ontario. Its wood, which is light and resistant to decay, is used for posts, poles, boats and other purposes where timber is exposed to situations favourable to decay. Western Red Cedar is of major importance in British Columbia where it ranges from the Pacific Coast to the Rocky Mountains. It is used for lumber, exterior siding, shingles, poles and posts, doors, window sashes and other purposes where resistance to decay is required. Yellow Cypress—commonly called Yellow Cedar or Alaska Cedar—is found mainly in the Pacific Coast region where it grows down to sea level in the more northerly sections. As it extends farther south, it seeks higher elevations. Its wood, like that of the other cedars, is valued in situations where resistance to decay is needed.

There are ten native species of maple, six of which are of commercial value. Only two species are known as hard maples, producing wood that is both hard and strong—Sugar Maple and the closely related Black Maple. Sugar Maple ranges from the Atlantic to Lake Superior, while Black Maple is found mainly in southern Ontario. Hard maple constitutes one of the most valuable commercial hardwoods in Canada. It is used for furniture, flooring, veneer, quality plywood, turnery and other specialized purposes where strength

and hardness are needed. Sugar Maple and, to a lesser degree, Black Maple are tapped for the maple sugar industry. Bigleaf Maple is found on the lower Pacific Coast mainland and on Vancouver Island. The wood is only moderately hard and lacks strength but, owing to the limited local supply of hardwoods, this tree is of some importance for furniture and other specialized uses in the immediate area. Red Maple and Silver Maple are eastern species. Red Maple ranges from Newfoundland to western Ontario, while Silver Maple is concentrated mainly in southern Ontario and southwestern Quebec. Their wood is weaker and softer than that of the hard maples and these trees are not important timber producers. The Manitoba Maple, ranging from Ontario across the southern parts of Manitoba, Saskatchewan and southeastern Alberta, produces a soft, moderately light wood that is low in strength. It is better known as a shelterbelt tree.

There are three species of larch in Canada. Two of them—Eastern Larch, better known as Tamarack, and Western Larch—have commercial value. Tamarack is widely distributed from Newfoundland to the British Columbia-Yukon border and reaches far into the Northwest Territories. The wood is used for poles, posts, piling, boxes, crates and pulp. Western Larch, found mainly in southeastern British Columbia, is one of the important timber-producing trees of Western Canada. The wood, being hard and strong, is used mainly in construction but is also made into flooring, interior and exterior furnishings, and pulp.

Other trees of less commercial significance include oak, ash, beech, elm and basswood. Valuable as the wood of these species may be, it is usually obtainable in limited quantities only. However, the species may have considerable local importance and they also contribute greatly to the forest landscape.

Canada's total forest wealth is measured by the diversity as well as by the abundance of its trees. The better known species are the commercially exploited trees, but in the forest all species have a role to play in maintaining the ecological balance, controlling water run-off and preventing soil erosion, and also in providing a habitat for native fauna and recreational facilities for all who wish to enjoy them.

## Section 2.—Forest Depletion

The average annual forest depletion by cutting and fire is shown for the five-year period 1964-68 in Table 4. The primary sources of Canada's current wood production are the areas of Crown forest land allocated to wood production and private forest land. These two ownerships constitute 434,850,000 acres and, of that area, 1,803,000 acres, or less than one fifth of 1 p.c., were cut annually over the period shown and 593,000 acres, or about one tenth of 1 p.c., were burned. On a volume basis, the average annual depletion from cutting was 3,781,550 M cu. ft., which may be compared with an estimated permissible cut on a sustained-yield basis of 8,480,800 M cu. ft. from approximately the same areas of Crown and private land. In addition to cutting and fire, extensive forest depletion is caused by insects, diseases and natural mortality but no reliable estimates of these losses, either physical or economic, are available.

In aggregate, a large surplus of timber exists in Canada although there are shortages in some regions and shortages in some species which could be overcome by increased silvicultural and management inputs where such are considered to be economic. Also, greater utilization of individual trees and certain species could further extend the resource. Federal and provincial forestry programs are outlined in Section 4, pp. 665-677.

**Forest Fire Statistics.**—The number of forest fires reported in 1969, at 6,633, was substantially below the 7,701 in 1968 and the 8,650 in 1967. However, despite the reduction in fire incidence over these three years, the 2,331,378 acres of forest land destroyed by fire in 1969 was not only greater than that reported in either 1967 or 1968 but also surpassed the corresponding ten-year (1959-68) average by some 130,000 acres. The Yukon and Northwest Territories had by far the worst fire season of any region in Canada, accounting

for 68 p.c. of the total acreage burned. By comparison, the central and eastern provinces had one of their easiest years on record; they were responsible for 40 p.c. of the forest fires reported but their proportion of the area burned was only 1.5 p.c. and of the fire-fighting costs and damages, only 5 p.c. of the national total.

#### 4.—Forest Utilization and Depletion by Fire, Five-Year Average 1961-68

Item	Usable Wood	Percentage of Total Depletion
	'000,000 cu. ft.	
Products Utilized—		
Logs and Bolts—		
Domestic use.....	2,229	53.5
Exported.....	24	0.6
Pulpwood—

<b>Totals, Utilization.....</b>	<b>3,782</b>	<b>90.7</b>
Wastage—		
By forest fires.....	388	9.3
<b>Totals, Depletion.....</b>	<b>4,170</b>	<b>100.0</b>

Table 7, which classifies forest fires by cause, indicates close agreement between percentages for the current year and those for the eight-year average 1961-68. Lightning continued to be the major cause, accounting for 1,658 forest fires or a quarter of the 1969 total. Recreationists caused the second greatest number—1,345 or one out of every five fires reported. However, the lightning-caused fires were responsible for 65 p.c. of the total area burned compared with only 2 p.c. for recreationist-caused fires, probably because the latter are likely to be in areas more accessible to the fire fighters.

**Section 3.—Statistics of Forest and Allied Industries**

This Section is concerned with the many industries engaged in the felling of timber and its transformation into a great variety of products required in modern living. The extensive forests of Canada provide raw materials for several large and growing primary industries, i.e., the sawmills and planing mills, the shingle mills, the veneer and plywood mills, the particle board plants and the pulp and paper mills, which in their turn provide raw materials for a wide range of secondary industries that convert the products of the primary industries into more highly manufactured goods such as sash, doors, millwork, wooden boxes, furniture, converted papers and paper goods, etc. However, much of the output of the primary forest industries is exported; the sawmill industry and the pulp and paper industry, especially, contribute substantially to the value of the export trade of Canada and thereby provide an important part of the foreign exchange necessary to pay for the imports from other countries.

Statistics of manufacturing activity and total activity of the wood industries and the paper and allied industries may be found in a number of tables in Chapter XV on Manufactures.

### Subsection 1.—Logging Industry

The forests of Canada provide the raw materials for its sawmills and planing mills, shingle mills, veneer and plywood mills, particle board plants and pulp and paper mills as well as roundwood for export in unmanufactured state and other products such as fuelwood, poles and piling, fence posts, mining timber, Christmas trees, etc. Tables 8 and 9 give the estimated quantities of wood cut in Canada, by province and by type of product. In estimating the annual cut, certain factors have been used to convert commercial units to cubic feet. These are as follows (British Columbia estimates are supplied by the British Columbia Forest Service):—

Product		Equivalent Volume in Cubic Feet		
		British Columbia Coast	Interior	Other
Logs and bolts.....	M ft.b.m.	166.6	173.9	200
Pulpwood.....	cord	80	80	85
Fuelwood.....	"	80	80	80
Round mining timber.....	"	100	100	85
Wood for charcoal.....	"	...	...	80
Fence posts.....	No.	1	1	1.2
Fence rails.....	"	1	1	1

### 8.—Volume of Wood Cut, by Province, 1965-69

### Subsection 2.—Wood Industries

The standard industrial classification subdivides the wood industries group into the following industries: sawmills and planing mills, shingle mills, veneer and plywood mills, sash, door and other millwork plants, hardwood flooring mills, wooden box factories, the coffin and casket industry and miscellaneous wood industries. The latter item is further subdivided into the wood preservation industry, the wood handles and turning industry, and miscellaneous wood industries, *n.e.s.*

The sawmills and planing mills, the shingle mills, the veneer and plywood mills and the particle board plants (the latter are included in the miscellaneous wood industries, *n.e.s.* group) use mainly roundwood as a raw material and sometimes are called primary wood industries and are dealt with separately below. The other industries, which constitute the secondary wood industries, further manufacture part of the production of the primary wood industries into a great variety of products. However, most of the production of the primary wood industries is not further processed.

**Sawmill and Planing Mill Industry.**—Lumber is by far the most important single product of this industry and, as shown in Table 10, British Columbia is the most important province in this field. It should also be noted that the shipment figures of Tables 10 and 11 contain a certain element of duplication because sales of lumber from one sawmill to another will be reported as shipments by both establishments. Similar situations occur in most industries to a greater or lesser extent.

In addition to the lumber produced by the sawmill and planing mill industry, a small amount is produced by establishments classified to other industries, bringing total lumber production in Canada in 1969 to 11,535,170 M ft. b.m. compared with 11,351,000 M ft. b.m. in 1968.

### 10.—Lumber Production and Shipments and Value of All Shipments of the Sawmill and Planing Mill Industry, by Province, 1968 and 1969

Year and Province or Territory	Lumber			Value of Shipments of Goods of Own Manufacture

Other.....	358, 854	31, 889	302, 597	32, 154	265, 440	29, 220
<b>Totals.....</b>	<b>10, 335, 148</b>	<b>803, 262</b>	<b>10, 987, 031</b>	<b>1, 002, 407</b>	<b>10, 916, 991</b>	<b>1, 058, 066</b>

**Shingle Mill Industry.**—Most of the shingles and shakes produced in Canada are from British Columbia mills. All establishments classified to this industry reported, for the year 1969, shipments of 2,187,184 squares of shingles and shakes valued at \$42,057,000, of which British Columbia accounted for 2,050,202 squares valued at \$40,620,000. However, it should be mentioned that considerable quantities are produced by establishments classified to other industries and by individuals intermittently operating one or two shingle machines or producing by hand; although no adequate measure of this production is available, it is known to contribute significantly to the total. Of the total production in 1969, 2,396,000 squares were exported, 2,337,000 squares going to the United States.

**Veneer and Plywood Industry.**—The production of hardwood veneer and plywood in Canada is confined largely to the eastern provinces and the production of softwood veneer and plywood almost entirely to British Columbia. For the latter, Douglas-fir is most commonly utilized because of the availability of large-diameter logs of this species from which large sheets of clear veneer can be obtained. Of the hardwoods, Yellow Birch is by far the most important species. Although most of the raw materials for this industry are of Canadian origin, some decorative woods are imported, particularly walnut.

About 54 p.c. of the shipments of veneer, shown in Table 12, are softwood veneers; most of these are further manufactured into plywood by Canadian mills, thus contributing to the shipments of plywood shown in the same table. Some of the hardwood veneers are also shipped to other veneer and plywood mills for further manufacture or to other industries such as the furniture industry for veneering purposes, but a significant portion is exported. Total exports in 1969 amounted to 938,138 M sq. ft. valued at \$29,290,400, of which 875,797 M sq. ft. valued at \$25,075,000 went to the United States.

Most of the plywood is consumed in Canada, although exports are not unimportant; in 1969 these amounted to 35,334 M sq. ft. of hardwood plywood valued at \$6,145,000 and 643,350 M sq. ft. of softwood plywood valued at \$44,639,000. The greater part of the exports of hardwood plywood went to the United States (32,048 M sq. ft. valued at \$5,400,000) but most of the softwood plywood exports went to Britain (447,937 M sq. ft. valued at \$31,233,000).

### 12.—Veneer and Plywood Shipments, by Type, 1967-69

Type	1967		1968		1969	
	Quantity	Value	Quantity	Value	Quantity	Value
	M sq. ft.	\$'000	M sq. ft.	\$'000	M sq. ft.	\$'000
Veneer.....	2, 294, 661 <sup>1</sup>	48, 330	2, 582, 055 <sup>1</sup>	55, 450	2, 788, 589 <sup>1</sup>	56, 307
Softwood plywood.....	1, 791, 435 <sup>2</sup>	142, 648	1, 953, 735 <sup>2</sup>	163, 513	1, 907, 330 <sup>2</sup>	171, 741

<sup>1</sup> Surface measure.<sup>2</sup>  $\frac{3}{4}$ " unsanded basis.<sup>3</sup>  $\frac{1}{4}$ " sanded basis.

### Subsection 3.—Paper and Allied Industries

The standard industrial classification subdivides the paper and allied industries group into the following industries: the pulp and paper industry, the asphalt roofing manufacturers, the paper box and bag manufacturers, and other paper converters. Statistics of manufacturing activity and total activity of the paper and allied industries group are given in Chapter XV on Manufactures.

**Pulp and Paper Industry.**—This industry is by far the most important of the group. In fact, it has been for many years the leading industry in Canada, contributing about 2 p.c. of the total gross national product and close to 14 p.c. (1969) of the total value of the country's exports. There were 138 pulp and paper mills in operation in 1969.

These mills consume enormous quantities of roundwood, 20,332,821 rough cords with a cost value of \$586,204,000 being so used in 1969. In that year, 109,000 cords of pulpwood were imported and 1,036,000 cords were exported. In addition, the pulp and paper mills use wood residues of the sawmill and other industries for pulping, such as cores of peeler logs, slabs and edgings or wood chips made thereof, shavings, etc., and recently even sawdust has been used successfully for this purpose. The total of such wood residues used by the industry in 1969 amounted to the equivalent of 7,523,668 rough cords of pulpwood, valued at \$160,347,000. The industry also consumes large amounts of electric power, chemicals and other goods and services and requires great quantities of clean water.

Some of the production of the pulp and paper industry is consumed in Canada or serves as a raw material for the paper-using or secondary paper and allied industries and certain other industries, but a great part of it is exported, particularly newsprint and various types of pulp (see Table 15), most of it to the United States. Some plants included in the pulp and paper industry classification also convert basic paper and paperboard into more highly manufactured papers, paper goods and boards but their output represents only a small part of Canada's total production of converted papers and boards. Tables 13 and 14 give shipment and production figures for pulp and shipment figures for basic paper and paperboards for 1965-69 and Table 15 shows exports of pulp and of newsprint to Britain, United States and all countries for 1965-70.

### 13.—Pulp Shipments and Production, 1965-69

Item	1965	1966	1967	1968	1969
<b>Mill Shipments of Pulp<sup>1</sup>.....'000 tons</b>	<b>4,650</b>	<b>5,066</b>	<b>5,150</b>	<b>5,985</b>	<b>6,899</b>

<sup>1</sup> Figures differ slightly from Statistics Canada figures given in Tables 14 and 15 because of different bases of calculation.

**Asphalt Roofing Manufacturers.**—These establishments produce composition roofing and sheathing, consisting of paper felt saturated with asphalt or tar and, in some cases, coated with a mineral surfacing. They also produce vinyl-asbestos and pure vinyl floor tiles. Their total shipments in 1969 were valued at \$63,442,000 compared with \$58,567,000 in 1968.

**Paper Box and Bag Industries.**—These industries include manufacturers of folding cartons and set-up boxes, manufacturers of corrugated boxes and manufacturers of paper bags. Their total shipments in 1969 amounted, respectively, to \$174,607,000, \$274,132,000 and \$184,411,000, compared with \$166,486,000, \$240,045,000 and \$170,083,000, respectively, in 1968.

**Other Paper Converters.**—This group produces a host of paper products such as envelopes, waxed paper, clay-coated and enameled paper and board, aluminum foil laminated with paper or board, paper cups and food trays, facial tissues, sanitary napkins, paper towelling and napkins, toilet tissue, etc. The total value of manufacturing shipments of this industry in 1969 amounted to \$365,946,000 compared with \$339,960,000 in 1968.

## Section 4.—Forest Administration, Research and Conservation

### Subsection 1.—Federal Forestry Program

**Administration.**—The Federal Government is responsible through several departments and agencies for the protection and administration of the forest resources in the Yukon and Northwest Territories and on other federal lands such as the national parks, Indian reserves, military areas and forest experiment stations.

The primary federal organization concerned with forestry is the Canadian Forestry Service of the Department of the Environment. This Service promotes the effective management and use of the nation's forest resources by: (1) conducting research in the forest resource and forest products fields; (2) undertaking, promoting and recommending measures for the encouragement of public co-operation in the protection and wise use of the forest resources of Canada; (3) entering into agreements with provincial governments and individuals relative to forest management, protection or utilization, for the conduct of research relating thereto, or for forest publicity or education; (4) providing forest surveys and advice on protection and management of federally administered forest lands; and (5) assuming responsibility for forest protection and management on federal lands at the request of the department or agency concerned.

Heading the Canadian Forestry Service is an Assistant Deputy Minister responsible to the Deputy Minister of the Department. Reporting to the Assistant Deputy Minister are the Directors of Coordination, Operations, and Forestry Relations. The three Directors are responsible respectively for: program development, co-ordination and control; the control and co-ordination of management resources (including personnel, finances and facilities); and forestry matters involving other federal and provincial government departments as well as national and international agencies and organizations. Within the Service there are seven research institutes undertaking work which, for the most part, has broad national applications. This research supports and complements the activities of the Pacific, Northern, Great Lakes, Laurentian, Maritimes, and Newfoundland Forest Research Centres which together serve all of Canada. Forest products research is conducted at the Western Forest Products Laboratory in Vancouver and at the Eastern Forest Products Laboratory in Ottawa.

The forestry program of the Canadian Forestry Service falls within three categories—forest resource research and services, forest products research and services, and support of university research.

**Forest Resource Research and Services.**—The work undertaken in this category covers research, surveys and related services pertaining to forest land and forest soils; forest inventory and mensuration; silviculture and tree biology; timber harvesting; protection against fire, insects and diseases; and forest economics.

Research in forest land is directed largely toward establishing practical land classification systems for forestry purposes. In forest-soils research, programs dealt with include soil chemistry, soil biology and the hydrologic characteristics of watersheds but, currently, considerable emphasis is being given to forest fertilization and related mineral-nutrition studies.

Considerable attention is devoted to improvement of forest inventory techniques; large-scale aerial photography, combined with a radar altimeter, has been developed to the point where it is in operational use in a forest inventory of Labrador. Research in new techniques of remote sensing for forestry purposes is accelerating, and the possibility of ultra-small-scale, high-altitude aerial photography and satellite photography is being investigated. Studies of growth and yield, the evaluation of site potential, and the development of mathematical models for trees and forests are continuing to provide valuable information for reforestation operations and for forest management.

A substantial portion of the research program in silviculture involves the study of factors responsible for the success or failure of natural regeneration following various methods of cutting and treatment of seedbeds; the development of improved methods of regenerating forest stands following logging or fire; and the establishment of forests on abandoned farmland, heathland or bogland. Different methods of seeding and planting are being compared, and increased emphasis is being given to problems associated with container planting. The effects of mechanization of logging on reproduction and on slash and soil conditions are being investigated. Studies of different methods of stand-tending such as pruning, cleaning and thinning are under way to determine means of increasing both quantity and quality of wood production. Investigations of successional changes are in progress in most of the important forest types, and the relation of forest growth to site is being studied with a view to the assessment of long-term productivity. The light, temperature and moisture conditions required to produce optimum growth and development of various tree seedlings are being determined to provide guidelines for improved forestry practices. In tree breeding, superior strains are selected or developed, and there is continual improvement in propagation and breeding techniques.

Research on timber harvesting has been intensified by work conducted within the logging development program of the Forest Management Institute. The objective of this work is to improve logging productivity and reduce the cost of wood delivered from the standing forest to the consuming mills.

Adequate protection of forests against fire is of vital importance in Canada. The Service works in full co-operation with provincial forest services in almost all phases of forest fire control and has made major contributions in the fields of forest fire danger measurement and forecasting and in fire control planning. Investigations are being made of forest fire behaviour, of the use of prescribed fire for hazard reduction and seedbed preparation, of better methods of reporting forest fires, and of fire damage appraisal and related factors in forest protection standards. Studies are being continued in the use of chemicals for fire suppression and pre-suppression, of fire-fighting equipment and techniques, and of the use of aircraft in forest fire control. Another important field of endeavour is the study of fire hazard created by slash from various kinds of logging practices for different species.

Research on forest insects and diseases is conducted at Service research centres and field stations throughout Canada. A Canada-wide survey is undertaken in co-operation with the provincial forest services and forest industries to maintain an annual census of forest insect and disease conditions and to detect and predict the occurrence of outbreaks. Survey results are made available to owners and operators of forest lands for use in planning salvage programs and directing control measures to reduce damage.

Experiments are also carried out in insect and disease control, utilizing cultural techniques, chemicals and biological control agents including parasites, predators and insect pathogens. Technical advisory services are provided in evaluating quarantine programs, possibilities of eradication or control, or other applications of research results. Examples include recommendations for reduction of seedling losses in forest tree nurseries through cultural techniques and chemical applications; the co-operative organization of cull surveys to improve forest inventories; consultation and advisory services for local authorities on the Dutch elm disease problem; and technical co-operation with provincial governments and industrial agencies in the organization of spraying operations. Of particular significance in the summer of 1971 were the large-scale chemical control operations covering about 7,500,000 acres of forest land infested with spruce budworm in the Maritimes, Quebec and Ontario areas.

Research programs are designed to lead to comprehensive understanding of the biology and ecology of the more destructive forest insects and fungi, and the causes of fluctuations in abundance or severity of damage in time and place. Problems under intensive study include insect defoliators, leaf diseases, sucking insects, dwarf mistletoes, stem cankers, bark- and wood-boring beetles, trunk and root decays, tip- and root-boring insects, and

*The Eastern Forest Products Laboratory of the Department of the Environment has applied for patents on a promising new non-leachable fire-retardant developed by its scientists. A cedar shingle roof deck, treated with the retardant, is shown undergoing test.*

diseases of tree seedlings in forest nurseries. Problems of national importance in insect pathology, cytology and genetics, bio-climatology and chemical control are investigated.

Current research in the economics of forestry includes the compilation and assessment (on a national basis) of forest inventory data in order to develop a better understanding of the economic availability of timber and forest resources. Studies of the future demand for Canadian forest products, including trends of wood used in residential construction and the potential for forest products trade with Japan, are related to the supply situation. Other current work focuses on the impact of forest industries on a local economy, the economic implications of pollution control for the pulp and paper industry, and the development of methods to predict lumber prices.

**Forest Products Research and Services.**—This work is directed toward obtaining background data on the properties of Canadian woods, developing new and better uses for wood products, improving methods of processing, effecting more complete utilization of wood substances, and reducing the pollution of air, water and land which may result from the operation of forest industries. Activities cover all major aspects of forest products and include: the determination of the physical, mechanical, chemical and anatomical properties of wood and their relation to adaptability in use; studies of factors affecting quality of wood and of manufactured wood products; determination of factors that cause wood waste in logging and manufacturing; investigation into fire retardant treatments, the preservative treatment and painting of wood and the use of wood for the manufacture of a variety of products by chemical or mechanical means; and studies to determine possible new economic and more valuable uses for woods and to determine methods for the economical utilization of all wood substances available from the annual timber harvest.

The program is conducted mainly at two laboratories—Ottawa and Vancouver—with research units covering timber engineering, containers, glues and gluing, veneer and plywood, timber physics, wood chemistry, pulping, wood preservation, paints and coatings, wood pathology, products entomology, wood anatomy, logging, lumber manufacture and

lumber seasoning. Research results are made available to the thousands of plants comprising Canada's timber-manufacturing and wood-using industries. Liaison is maintained with these industries to ensure that the research being conducted is of optimum national benefit. There is also constant co-operation with various government units in conducting many investigations concerned with wood use. Research into the use of wood in housing construction and as an engineered material continues in co-operation with the National Research Council and the Central Mortgage and Housing Corporation.

Through the medium of research contracts awarded to industry, provincial research councils, universities and others, a program has been established to abate pollution caused by the pulp and paper industry. The objective is to find cheaper and better methods for reducing the amount of dissolved wood substances and harmful chemicals released into receiving waters.

A number of regional establishments have forest products liaison officers who visit sawmills and other wood-working plants to keep industry aware of research developments and technical advances and to ensure that the Service is informed of field problems on which research would be of value.

Continuing research on the economics of forest products covers a survey of lumber and wood-based panel products utilized in residential dwellings, together with a study of possible future markets for lumber and plywood.

Service personnel serve on many national and international technical committees concerned with forestry problems, and continuous collaboration is maintained with forest products laboratories in other countries for the dual purpose of exchanging information and avoiding duplication of research.

**Support of University Research.**—Operating grants are made available to the four Canadian forestry schools to assist their development through support of research conducted by faculty members and postgraduate students.

*Models of spherical house frames fabricated in the Western Forest Product Laboratory. This unique building concept, designed by University of British Columbia students in architecture, uses a minimum of materials and has other advantages of light weight and low heating and construction costs that would make it practical for many applications.*

### Subsection 2.—Provincial Forestry Programs

All forest land in provincial territory, with the exception of the minor portions in national parks, federal forest experiment stations, military areas and Indian reserves, is administered by the respective provincial governments. The forestry program of each province is outlined below.

**Newfoundland and Labrador.**—Geographically, the Province of Newfoundland has two separate regions—the Island and Labrador on the mainland. The productive forest land is estimated at approximately 34,000 sq. miles—about 13,000 sq. miles on the Island and 21,000 on the mainland. Most of Labrador's forests are leased but are as yet virtually untouched.

A large part of the forest land of the Island is leased, licensed or owned by paper companies, but a three-mile-wide belt along most of the coastline is retained as unoccupied Crown land for the purpose of providing firewood, construction material, fencing material, etc., for the local populations. Within this coastal forest belt, every form of cutting is generally without intense control or restriction but a policy is being introduced whereby cutting in certain 'management areas' is controlled by Forest Service Officers. Approximately one half of the Crown forests are at present under management. Commercial timber-cutting on unoccupied Crown lands has been by permit since 1952; permits for amounts up to 120 cords per person are issued by the field staff but permits for larger quantities must be approved by the government.

The Island is divided into three forest regions, each of which is subdivided into five districts. Each region is under the control of a regional forester and each district is headed by a district ranger with a staff of rangers and assistant rangers. Twenty-four well-equipped forest fire depots and six lookout towers, connected by radiotelephone to district and regional offices, are operated by the Newfoundland and Labrador Forest Service; others are operated by the two paper companies which maintain their own forest fire protection organizations.

Forestry operations in Labrador are under the supervision of a regional forester located at Happy Valley (Goose Airport). Forest fire protection bases are located near Goose Airport and at Labrador City, Churchill Falls and Cartwright.

The Forest Service operates eight fixed-wing aircraft for forest fire detection and suppression and four helicopters for transporting men and equipment. The permanent Forest Service staff of approximately 130 persons is enlarged during the fire season with the addition of about 70 seasonal employees.

**Prince Edward Island.**—Roughly one third of Prince Edward Island's 2,184 sq. miles of land is tree-covered. The wooded areas consist of scattered patches throughout the province, the greatest concentration being in the eastern section. All of the woodland is privately owned except some nine square miles of provincial forested Crown land.

The Forestry Branch of the Department of Agriculture administers all forestry matters in the province—reforestation, protection and woodlot improvement. The reforestation program has been increasing year by year, as many as 500,000 trees being planted in one year on provincially owned and privately owned land. The Forest Nursery is being expanded and by 1975 will be providing some 6,000,000 trees annually.

The forest management programs include the provision of access roads into Crown land areas and woodlot improvement; improvement cuts act as demonstration areas for the public and for 4-H Forestry Clubs and Boy Scout and Girl Guide groups. Fire protection is not too serious a problem in this province as wooded areas are relatively small and scattered and are all accessible by road so that equipment can be rushed to the scene of a fire quickly and easily.

**Nova Scotia.**—Of Nova Scotia's land area of 20,402 sq. miles, 15,555 sq. miles are classed as forested and most of the forested land is considered suitable for regular harvesting.

Although 91 p.c. of the forest land in Canada is held by the Crown in the right of the federal and provincial governments, only 22 p.c. is so held in Nova Scotia. To promote education and dialogue among various forest users, representative county Forest Practices Improvement Boards are being set up.

The provincial Crown lands are administered by the Department of Lands and Forests through a staff of foresters and rangers. Trained provincial personnel are also employed with some of the forest industries in the administration of privately owned forest lands. The Department administers the Lands and Forests Act as it pertains to all lands, and is responsible for forest fire suppression. Forest fire detection is facilitated through 35 observation towers and a six-plane aerial patrol service. In 1970, 450 forest fires burned 1,767 acres. Three fires exceeded 100 acres, and 32 p.c. were under one-quarter acre. Fire suppression crews and rangers with equipment are stationed throughout the province.

The forest industry is of prime importance to the economy of Nova Scotia, contributing directly or indirectly over \$100,000,000 to the gross provincial product annually. There are in operation some 350 sawmills of various types and sizes, one hardboard mill, one newsprint mill, two groundwood pulp mills, and two chemical pulp mills. These mills accounted for 197,000 M ft. b.m. of sawn materials and 954,000 cords of pulpwood in 1970, including 126,000 cords-equivalent of pulp chips from sawmill residues. In addition, 98,000 cords of pulpwood were exported and 9,000 cords of pit props, poles and pilings were produced.

The reforestation program, active since the 1930s, is being expanded. Experimental work on container planting, direct seeding, soil capability, and site preparation continues. Efforts are being made to improve seed sources. Seedbeds have been laid for a threefold increase to 3,000,000 seedlings by 1973.

Timber, pulpwood and Christmas trees are sold through public tender, and cutting on Crown lands is done under recommendation of resource managers of the Department of Lands and Forests. Management cruises, regeneration studies and experimental cuttings are conducted on Crown lands, and a program of operating these lands under sustained-yield management is under way. During 1970-71, 3,700 acres of Crown forest were thinned, fertilized and improved, bringing the total acreage of Crown silvicultural treatments to 29,000 since 1965.

A provincial forest inventory, a continuous system designed to operate on a seven-year cycle, was in its fourth year in 1970. A system of 1,750 permanent sample plots was completed to provide continuing data on growth and drain. Aerial colour photography, begun on Cape Breton Island in 1969, is being extended to the remainder of the province.

Forest research is carried on by Federal Government agencies and by the Nova Scotia Research Foundation. Investigations cover stand improvement, tree nutrition, cutting methods, and insect and disease activities. Extension projects include fire prevention, a motion picture program for schools, distribution of information on forest and wildlife conservation, promotion of the Christmas tree industry, a hunter safety program, woodlot improvement, preparation of material for the mass media, and technical assistance to saw-mill operators.

**New Brunswick.**—Of the total land area of New Brunswick (27,835 sq. miles), approximately 87 p.c. is classed as forest land suitable for regular harvest of which the Crown, in right of the province, owns about 46 p.c. About 2 p.c. is owned by the Federal Government and the remainder is privately owned. The total volume of standing timber in the province is estimated at 16,868,000 M cu. ft.; coniferous species make up 71 p.c. and deciduous species the remainder.

Protection from forest fires, the first requirement for forest conservation, is mainly the responsibility of the Department of Natural Resources which also carries out duties in connection with game management and protection, provincial parks, mines, water, tourism and the administration of provincial Crown lands. A large-scale aerial spraying program to protect balsam fir and spruce from the spruce budworm has been carried on since 1952 by a Crown company sponsored by the federal and provincial governments and

by representatives of the forest products industries. Forest management licences authorize operators to cut and remove forest products in accordance with forest management plans and cutting permits. Royalty is paid to the province when products are cut by the licensees.

New Brunswick does not maintain a forest research organization but co-operates with the Canadian Forestry Service in that field. The University of New Brunswick has also undertaken a small number of forest research projects in co-operation with the National Research Council, the provincial government and other interested organizations.

In the field of education, the University of New Brunswick offers undergraduate and graduate courses in forestry leading to B.Sc.F. and M.Sc.F. degrees. It is also responsible for the administration of the Maritime Forest Ranger School in conjunction with the Governments of New Brunswick and Nova Scotia and with private industry. The forest extension services of the University assist both government and private agencies in the direction and planning of various forestry extension programs. The provincial Department of Agriculture and Rural Development also provides an expanding extension service to the owners of farm woodlots.

**Quebec.**—The forests of Quebec, which are of tremendous economic value to the province and to Canada, cover 268,480 sq. miles or about half of the territory of the province. They extend northward up to an irregular line roughly following the 52nd parallel of latitude in the eastern portion and the 54th parallel in the west.

These forests may be divided into two separate tenure groups—publicly owned forests covering 240,464 sq. miles, and privately owned forests totalling 28,919 sq. miles. Of the publicly owned forests, 103,252 sq. miles are “allocated to wood production”, 87,164 sq. miles of that area being classed as fully stocked. Of the privately owned forest land, 25,931 sq. miles are classed as stocked. The publicly owned forests allocated to wood production and the stocked privately owned forests supply the province's pulp and paper mills and sawmills. Privately owned forests alone produce about 25 p.c. of the annual cut, which reaches close to 1,000,000 M cu. ft. Publicly owned forests are subjected to a general development plan to meet the ever-increasing demand for forest products.

The Woodlands and Forestry Branch of the Department of Lands and Forests is responsible for the management, development, control and supervision of publicly owned forests; in certain circumstances, and when required by the public interest, it also handles the development of privately owned forests. The Branch operates, throughout the province, a number of nurseries which provide the seedlings needed for reforestation areas where natural regeneration is inadequate. The nurseries have in stock about 100,000,000 seedlings.

The Conservation Branch, either directly or through various organizations, is responsible for the protection of forests against fires, insects and cryptogamic diseases.

Quebec's forests account for about 25 p.c. of the value of gross production in the province. The importance of such an economic input deserves intensive consideration and for this reason the Department of Lands and Forests periodically reviews its forestry program and keeps abreast of progress in all phases of forestry in order to assure the maximum yield from its forest wealth.

**Ontario.**—Forested land in Ontario amounts to 188,335 sq. miles,\* of which 180,424 sq. miles are classified as forest land, that is, bearing or capable of bearing timber of a commercial character suitable for regular harvest and not withdrawn from such use. About 90 p.c. of this forest land is owned by the Crown, administered and managed by the Ontario Department of Lands and Forests. This Department was reorganized as of Apr. 1, 1971, resulting in a head-office structure in which four major Divisions and one Branch (Research) report directly to the Deputy Minister. The Divisions and their constituent Branches are: Resource Products (Timber Sales, Timber Management, Commercial Fish and Fur, and Resource Economics); Land Management (Lands and Waters, Environmental Protection,

\* See footnote 1, Table 1, p. 652.

and Surveys and Engineering); Outdoor Recreation (Parks and Recreation Areas, Sport Fisheries, and Wildlife); Finance and Administration (Legal Services, Personnel Services, and Financial Management).

An objective of the changes was to provide greater and more convenient services to the public. Thus, there has been a considerable transfer of additional responsibility and authority to the three Regional Directors and to the 21 Forest Districts that make up the field organization. Specialists in the field correspond closely to the functions of head office.

The *Timber Sales Branch* arranges for the orderly sale of timber, a function carried out along traditional lines—operators are granted a licence to cut specified timber for which they pay stumpage at contractual rates on the measurement (scale) of products removed. However, the details and techniques of utilization are undergoing constant improvement. Ontario's forest-based industries have long been a Canadian leader in terms of diversity of products and value of shipments and, even though there is still a surplus of timber over actual cutting in the province, an effective management policy is operative to ensure the continuing supply of timber of the type required by industry. Continuing forest inventories, using aerial photographic methods in which the province pioneered, provide an up-to-date record of the forest wealth, showing the species and other characteristics of stands and their geographical distribution. Inventory data are then applied to management planning; the province has been divided into 205 management units, each homogeneous with respect to forest and use patterns. Long-term plans set out regulations on the volume and location of cuttings and include programs for regeneration and tending that will sustain yields. As of 1971, 196 plans (79 Crown Units, 57 Company Units and 60 Agreement Forests) were either completed or in process of completion for approximately 197,000 sq. miles.

The *Timber Management Branch* is responsible for the regeneration, tending and improvement of the forests on Crown lands, Municipal and Conservation Authority Agreement lands and Private Agreement lands. In addition, the Branch has the important task of promoting forestry on privately owned lands through its extension program. The three main pieces of enabling legislation in this regard are the Forestry Act, the Woodlands Improvement Act and the Trees Act.

The Branch operates 10 forest tree nurseries (with supporting tree seed collection, treatment and storage plant) currently geared for an annual output of about 100,000,000 units. Complementing this are up-to-date tree improvement and nursery soil management programs. The Department, directly or indirectly, supervises all planting projects on Crown lands but regeneration agreements have been signed with all major licensees whereby they assume responsibility for the conduct of planting projects, receiving payment at an agreed rate for work completed. Other projects, such as site preparation for the planting, may be performed by the companies under the same agreement.

During 1970, 50,700,888 nursery-produced trees were planted on about 71,253 acres of Crown and Agreement lands, and 7,364,000 tubed seedlings were planted on about 7,997 acres. Other silvicultural treatments included the direct seeding of 20,392 acres, treatment for natural regeneration on 29,214 acres and stand improvement (cleaning, spraying, thinning, pruning, etc.) on 110,462 acres. In all, 239,318 acres of Crown and Agreement lands were silviculturally treated in 1970 to promote regeneration or to improve the forests.

For half a century, Ontario has had enabling legislation that permits municipalities and, within the past 20 years, conservation authorities to place abandoned and submarginal agricultural lands to which they have acquired title under agreement with the Department of Lands and Forests; the Department undertakes to plant and manage the properties for a specified period of between 20 and 50 years. Nearly 248,000 acres currently under such agreements have been managed intensively and the older plantations are receiving regular thinnings. The trees removed are in demand for pulpwood, posts, poles and sawlogs, making the undertakings financially attractive. In addition, the properties that are close to centres of population have acquired tremendous value as recreational areas.

ing a 'sky-hook' to pick  
es from the top branches  
mature pine trees. The  
ection of seed for re-  
estation has become a  
or part of Ontario's  
ber management pro-  
gram.

Owners of private land may purchase planting stock for forestry purposes from government nurseries at nominal prices and may also receive free professional advice on any forestry matter, including silviculture, harvesting and marketing. In 1970 (spring and fall), planting stock furnished for private lands totalled 16,339,867 units and 41,964 units were furnished for educational and scientific purposes. Under the Woodlands Improvement Act, it is possible to have planting and improvement work carried out completely under government direction and mainly at public expense. In return, the owner is required to meet a few modest demands that ensure his good faith. Since its inception in 1966, the program has provided assistance for 112,071 acres (as of Apr. 1, 1971) of privately owned land of which 67,952 acres have been planted or improved, and 44,119 acres covered by management prescriptions only for future silvicultural requirements or harvest. During 1970-71 alone, 13,606 acres were either planted or improved.

The area under organized forest protection in Ontario totals 180,275 sq. miles and includes the main central band of accessible forests. This area is organized into 20 fire districts and subdivided into 50 chief ranger divisions. South of this area, in the highly developed agricultural counties, the municipalities are responsible for fire control. The vast inaccessible areas to the north of the fire districts, totalling over 134,000 sq. miles, do not support significant stands of merchantable timber and, except for communities or other special values, are not protected. Within the fire districts, agreements were in effect in 1970 with 220 municipalities for the prevention and control of forest fires. An agreement was also in effect with the Federal Government for the protection by the Ontario Department of Lands and Forests of 958,000 acres of Indian lands in the province.

Organized forest fire detection is accomplished by aerial patrol or combined aerial patrol and lookout tower systems, although towers are quickly being phased out in favour of aircraft. Public reporting of forest fires (unorganized detection) continues to be an important and very necessary part of the over-all detection program. The basic fire-fighting strike force comprised 135 trained, five-man fire crews and 38 water-bombing aircraft. These forces made the initial attack on 1,075 of the 1,239 fires in 1970. The public, municipal firemen, and forest industry personnel initially attacked 164 fires. Work with long-term fire retardant chemicals indicates that they can be useful in fire control operations in

Ontario; operational adoption, phased over the next two to three years, is planned. Prescribed burning as a silvicultural and hazard reduction tool was continued in 1970 with 15 burns covering 6,700 acres.

An integral float tank water-bombing system is installed on Department float-equipped aircraft. The aircraft fleet, as of Jan. 1, 1971, comprised 26 Turbo Beavers, 10 Otters, three Twin Otters, one Beechcraft Duke and one Beechcraft KingAir 100; five Bell G-4 helicopters were leased during the fire season. The communications system included 186 ground stations, 277 lookout tower radios, 20 patrol vessel radiotelephones, 674 mobile radiotelephones, 1,344 portable fireline radios, 41 aircraft radio installations and 74 portable aircraft radiotelephones.

Forest pest problems in 1970 were again dominated by the spruce budworm which infested almost 7,000,000 acres but spraying operations to control this insect were limited to 23,000 acres, involving four separate high-value local areas. Smaller acreages on Crown-owned and Crown-managed areas totalling 16,000 acres were also treated for White Pine weevil, pine and spruce sawflies, white grubs, White Pine blister rust, annosus root rot, and mice.

**Manitoba.**—The administration of the provincial Crown forest lands of Manitoba falls within the purview of the Department of Mines, Resources and Environmental Management which consists of a Resources Management Division, a Mines and Departmental Services Division, an Environmental Management Division, and an Air, Radio and Technical Services Division. A special planning section, directly under the Deputy Minister in conjunction with the Resources Management Division, has the responsibility for developing short- and long-range forestry plans and programs relating to the forest inventory, timber utilization and industrial development, reforestation, silviculture and forest protection.

The Research Branch of the Environmental Management Division undertakes the necessary practical research for the qualitative development of these programs and the various projects and activities within them. The Branch co-operates with several federal services which maintain two research areas in the province, and works closely with federal authorities in investigating and controlling forest damage resulting from insects and diseases.

The Resources Management Division is charged with the administration of the Forest Act and Regulations, and the implementation of forestry programs and projects developed. It also provides considerable input with respect to plans developed for specific areas within the four established administrative regions into which the province is divided. Each region is under a Regional Director who is responsible for the field administration of the forests and other resources in his region. He works under policy guidelines established by head office which co-ordinates control measures for the propagation, improvement and management of the forests, for the harvest of forest products, and for forest inventory surveys. A provincial forest nursery is maintained to supply stock for reforestation of denuded Crown land and some natural seed areas have been established for nursery stock. Seedlings are supplied to farmers for shelterbelts and woodlots and to commercial Christmas-tree producers and an average of more than 5,000,000 are planted each year in reforestation projects on Crown lands. The program of forest stand improvement comprises thinning, clearing and chemical spraying to remove undesirable species and encourage growth of preferred trees. Forest inventories cover about 10,350 sq. miles annually and, on the basis of these inventories, working plans with annual allowable cuts on a management unit basis are in operation.

Timber-cutting rights are awarded by Forest Management Licences, Timber Sales and, in certain cases (particularly for salvage operations), by Timber Permits. Forest Management Licences may be granted for periods of up to 20 years and are renewable; Timber Sales may be for varying periods from one year upward and Timber Permits for periods of up to one year. In 1971, one long-term Pulpwood Berth with an area of 2,745 sq. miles

and a second, signed in 1966, covering the construction of a pulp mill and sawmill at The Pas in northern Manitoba, were in force together with 10 long-term Timber Berths, all granted prior to 1930.

There are 128,370 sq. miles of the province under forest fire protection, with zones of priority established in the less accessible areas. Fires are detected through a comprehensive network of lookout towers and supporting air and ground patrols, all in communication by radio and departmental or public telephones. Two Canso water-bombers and three helicopters are rented for the fire season to supplement the 10 aircraft of the Manitoba Government Air Service.

Public education in the fields of fire prevention and forest conservation is carried out and use is made of radio, television, newspapers, pamphlets, signs, film tours and talks.

The Mines and Departmental Services Division provides accounting and clerical services for the two previously described divisions, and is responsible for the issuance of permits, licences and leases, relative to forestry projects and activities. The Air, Radio and Technical Services Division provides surveys, air service and other technical assistance as required.

**Saskatchewan.**—The forests of Saskatchewan, located in the northern half of the province, cover 40,500 sq. miles, of which area almost 34,000 sq. miles are suitable for regular harvest. Provincial forests constitute approximately 92 p.c. of all forest land in the province and are managed and developed by the Forestry Branch of the Department of Natural Resources.

The Forestry Branch, consisting of three Sections—Forest Management, Inventory and Silviculture—has the function of developing and evaluating forest policies and management programs and such policies and programs are carried out by the various regional administrative authorities. For purposes of resource administration, the province is divided into five regions, each under the supervision of a regional superintendent. The regions are subdivided into conservation officer districts which vary in size according to resource base and population to be served. Close liaison is maintained between the Forestry Branch and the various regional authorities.

Development of techniques in prevention, detection and suppression of forest fires is a function of the Forest Protection Branch which is comprised of three Sections—Fire Control, Heavy Equipment and Communications. A network of 75 lookout towers equipped with two-way radios is maintained throughout the province and is supplemented by aircraft on regular patrol duty during high-hazard periods. The Department of Natural Resources communication system is being converted to V.H.F. Approximately 1,400 two-way radio sets, operated in towers, vehicles, aircraft and bush camps, are used for the detection and suppression of forest fires and available for aerial assistance are three helicopters and seven fixed-wing aircraft capable of water-dropping. Outside help may be requested when available and necessary.

**Alberta.**—The 106,754 sq. miles of forest land in Alberta are administered by the Alberta Forest Service of the Department of Lands and Forests with Head Office at Edmonton. The Service, headed by the Director of Forestry, is composed of six Branches—Administration, Timber Management, Forest Protection, Construction and Maintenance, Land Use and Training. The forest area is divided into 11 Forests, each responsible for the forest within its boundaries and under the jurisdiction of a superintendent supported by a number of specialists in areas of timber management, fire, land use, construction and communications, and by a clerical staff and a complement of casual employees. These Forests are further subdivided into Ranger Districts, each supervised by a district forest officer responsible to the superintendent. A district forest officer may have several assistant rangers and other staff under his charge.

The Administration Branch supervises all Branches in maintaining general control over revenue and expenditure, equipment inventory and personnel. The general administrative policies of the Service are formulated by this Branch.

The function of the Timber Management Branch includes implementation and supervision of the timber quota system, acceptance and approval of management and annual operating plans prepared for leased and licensed Crown lands, preparation and execution of forest management plans, and disposal of Crown timber. The Branch also carries on silvicultural programs, processes applications, takes inventories of forest resources, inspects cutting areas to ensure proper logging and utilization practices, and collects dues and fees.

The Forest Protection Branch is in charge of all phases of protection including prevention, detection and suppression of wild fires. This Branch includes a number of specialists such as a meteorologist, a communications officer and a special Aircraft Dispatch Section to assist in the over-all protection program.

The Construction and Maintenance Branch constructs and maintains all road, airstrip and building facilities within the area of the Service's jurisdiction.

The Forest Land Use Branch is responsible for the planning and supervision of the proper land-use practices in the forested area, including grazing, recreation and watershed management, particularly on the east slopes of the Rocky Mountains containing the two Saskatchewan Rivers. The Forestry Training Branch provides facilities and instructions for the second year of a two-year forest technology course given by the Northern Alberta Institute of Technology. It also conducts in-service training programs for all the Branches in the Forest Service.

Basic research in all phases of the forestry program is generally carried out by the Canadian Forestry Service. A new federal research laboratory has been completed in Edmonton to increase the research service that is provided.

**British Columbia.**—Of the 366,255 sq. miles in British Columbia, somewhat over 215,743 sq. miles are inventoried as forest land.\* This includes 268,635,000 M cu. ft. of mature merchantable timber, most of it coniferous species.

For administrative purposes, the province is divided into five Forest Districts with regional headquarters at Vancouver, Prince Rupert, Prince George, Kamloops and Nelson. Further decentralization of authority is effected by subdivision into Ranger Districts, of which there are approximately 22 in each Forest District. Ten directional, servicing or policy-forming Divisions constitute the Head Office of the Forest Service at Victoria.

Efforts continue to bring British Columbia's forest resources under sustained-yield management and the forest industries are making progress toward more complete utilization of their raw materials. The problem is urgent despite the fact that, with a present annual scale of approximately 1,900,000 M cu. ft. (1970), the total inventory would appear sufficient to support current needs in perpetuity. One of the more spectacular results of sustained-yield administration has been the swinging of a greater proportion of the annual forest harvest to the interior of the province. In 1970, the over-cut coast (wet belt) forests accounted for about 52.7 p.c. of the total forest cut and the interior for 47.3 p.c. For all practical purposes, the entire interior forest is publicly owned; a large proportion of the privately owned, leased or licensed forests are on the coast.

Several systems of timber disposal are in effect. The Tree Farm Licence is a contract between the government and a company or individual whereby the latter agrees to manage, protect and harvest an area of forest land, including any privately held forest land, on a sustained-yield basis. Tree Farm Licences are subject to re-examination for renewal every 21 years. Public Sustained-Yield Units are areas within which the Forest Service manages the Crown timber on a sustained-yield basis. Within the Public Sustained-Yield Units, recognized established logging operators can apply for Timber Sale Licences or Timber

\* See footnote, Table 1, p. 652.

Sale Harvesting Licences which entitle them to log at a given rate per year, based on a number of factors including the operator's average rate of production at the time the unit was established.

Forest fire prevention techniques and organization for effective forest fire suppression are vital aspects of planned sustained-yield management. A greatly expanded pulp industry, added to the long-established logging and sawmill industries, has increased the necessity for more adequate fire control. Extensive use is made of aircraft under various terms of contract. Air tankers and fire-spotter aircraft are employed during the fire season and helicopters and other aircraft are employed under contract for patrol duties and for the transport of fire suppression crews. The rugged topography and the many remote and sparsely populated areas of the province demand the availability of a variety of transportation methods to tie in with early discovery of and attack on forest fires.

Close liaison with the Forestry Branch of the federal Department of the Environment through facilities at Victoria provides detailed information on insect and fungal enemies of the forest and on fire research.

### **Subsection 3.—The Pulp and Paper Research Institute of Canada**

The Pulp and Paper Research Institute of Canada is a centre of research and learning concerned with virtually every aspect of the production and use of pulp and paper products. It was established in 1913 as a branch of the Dominion Forest Products Laboratories and in 1927 was reorganized under the joint sponsorship of the Canadian Pulp and Paper Association, the Federal Government and McGill University. The Institute staff carries out fundamental research and some applied research in the fields of woodland operations and pulp and paper mill operations. In addition, in co-operation with McGill University, it trains postgraduate students who are working toward master's and doctorate degrees in physical chemistry, wood chemistry, or chemical and mechanical engineering, and whose theses subjects lie in fields of interest to the pulp and paper industry.

The Institute's head office and main laboratories are located in Pointe Claire on the western outskirts of Montreal in a recently enlarged building constructed by the Government of Canada. Space provided by the University is also occupied on the campus of McGill University by Institute staff and students involved in the graduate education program. The Institute's facilities include: organic and physical chemistry, physics and engineering laboratories; pilot plants for chemical pulping, pulp and chip refining and waste liquor pyrolysis; a greenhouse and other facilities for woodlands research; an extensive library; shops and special facilities for pulp and paper testing and for photographic and microscopic (both light and electron) studies of wood, pulp and paper. It has a staff of about 200.

The Institute's research activities comprise a basic program in pulp and paper research and in woodlands research, contract research, and technical services. The basic pulp and paper research program is supported by assessments from the Maintaining Membership (48 companies, representing more than 100 mills and about 95 p.e. of the total production of the Canadian industry). The woodlands research program is supported by assessments on all member companies of the Canadian Pulp and Paper Association east of the Rockies that use pulpwood. Both programs comprise research of interest to the industry broadly, as distinct from that which is the concern of a single company only.

The projects in the research program range from studies of the growing seedling in the forest to the converted pulp and paper product, and are directed at seven broad research goals: reduction of wood cost, reduction of fibre cost, reduction in capital and operating costs, testing and process control, products research, reduction of environmental pollution, and basic knowledge. The Institute is regarded as a centre for broad, long-range and uninterrupted studies of basic principles and for major engineering research and development projects which individual pulp and paper companies would find difficult to justify if

the costs were not shared. Moreover, the Institute is a centre of highly specialized equipment and manpower which individual companies would not normally have.

In addition to its permanent staff, the Institute, in co-operation with McGill University, has some 45 graduate students working on fundamental projects in the background of pulp and paper technology, which also serve as their theses topics. The E. B. Eddy Professor of Industrial and Cellulose Chemistry at McGill, who is also a staff member of the Institute, directs graduate student work on such subjects as the behaviour of the materials of which wood is made—cellulose, lignin and hemicelluloses. The Director of the Institute's Applied Chemistry Division, also a Professor in the McGill Chemistry Department, supervises graduate student work in polymer, surface and colloid chemistry with particular reference to those aspects that pertain to the physics and chemistry of pulp and paper. An Associate Professor of Chemical Engineering at McGill, who is a consultant to the Institute, directs graduate students in a variety of chemical studies. In addition, the Director of the Institute's Applied Physics Division, who holds a teaching appointment in McGill's Department of Mechanical Engineering, supervises graduate student investigations on such subjects as supercalendering of paper and frictional processes in polymeric systems. Other staff members who hold concurrent honorary positions at McGill as Research Associates assist in this student program.

The Institute undertakes contract research projects on a cost-reimbursement basis for individual companies or groups of companies in the pulp and paper or allied fields. The larger of these co-operative contracts have been concerned with problems of particular segments of the Canadian pulp and paper industry. The Institute also provides a broad range of technical information services to the industry and, to some extent, to other industries and the public. It maintains a specialized library for this purpose which stocks bibliographies, abstracts, translations and critical reviews for the use of the scientific staff and the industry.

## PART II.—FISHERIES\*

Following a period of rapid expansion and intensification of fishing effort by fleets of many nations, the fisheries resources within range of Canadian fishing vessels have shown evidence of approaching peak production levels; for some species those levels have already been surpassed. As a consequence, conservation of commercially valuable species is a subject of vital concern to Canada, and has spurred both domestic and international initiatives to curb the trend toward over-exploitation.

Canada's commercial fisheries on the Atlantic Coast concentrate upon large stocks of cod, flatfishes and herring, as well as valuable shellfish resources, notably lobsters, oysters and scallops; Pacific Coast fisheries depend mostly on salmon and halibut; herring stocks, once plentiful, are recovering from a sudden, sharp decline in the late 1960s which necessitated closure of the fishery except for catches used as human food. Large freshwater lakes in Canada's interior produce important supplies of whitefish, sauger, yellow perch, lake trout and other species.

### Section 1.—Fishery Statistics

The following brief review of commercial fishing and marketing covering the situation in 1970 contains estimated figures for that year. At the time of the preparation of this Chapter, however, the latest statistics available in detail for both the primary production and fish products were for 1969 and these are contained in Subsections 1 and 2.

**Fish Landings and Marketing in 1970.**—The total Canadian catch by some 65,000 fishermen in 1970 approximated 2,600,000,000 lb. valued at \$205,000,000. Although the quantity of commercial fish and shellfish landed was slightly lower than in 1969, the value

\* The introduction and parts of Section 1 and Section 2 were prepared by the Information and Consumer Branch, Canadian Fisheries Service, Department of the Environment, Ottawa.

was \$27,000,000 higher. During the year, Atlantic Coast fishermen landed 2,300,000,000 lb. with a value at point of first sale of \$131,000,000, compared with 2,400,000,000 lb. valued at \$121,000,000 in 1969. Each of the Atlantic Provinces except Nova Scotia received a share of the higher value—although the catch of most significant species decreased, the unit prices paid to fishermen were at record levels.

On the Pacific Coast, the quantity landed in 1970 was 238,000,000 lb., valued at \$60,300,000, a substantial advance over 1969 when only 174,000,000 lb. were landed valued at \$47,400,000. Higher quantities of all species of salmon brought the total value to a record \$45,000,000 but the value of the halibut fishery was down from its record in 1969 of \$14,400,000 to \$10,600,000 as prices to fishermen dropped from an average of 42.5 cents to 35.9 cents a pound.

The 1970 inland fisheries landings were estimated at 106,000,000 lb. valued at \$13,500,000, a 12-p.c. decrease in quantity and a 7-p.c. decrease in value compared with 1969. This drop resulted largely from the closure of a number of lakes to fishing and to the curtailment of fishing for certain species in other areas because of mercury contamination.

The 1970 marketed value of all Canadian fishery products was estimated to be above \$400,000,000, an amount that would surpass the 1968 record by some \$15,000,000. Of the total output, by value, about 70 p.c. was exported; three quarters of these exports went to the United States and about 20 p.c. to Europe. Fish product imports into Canada in 1970 went up by 22 p.c. over 1969; about half of these imports were of shrimp and tuna.

Because of the reduced landings of groundfish on the Atlantic Coast, the production of fillets and blocks dropped from 263,000,000 lb. in 1969 to 236,000,000 lb. in 1970. The decline was general for all species of blocks and fillets with the exception of flounder fillets. There was no difficulty in marketing any of the groundfish products during the year. Demand, reflected in high prices and lower stocks, outstripped supply. Production of salted groundfish continued its downward trend. About 80,000,000 lb. were put to salt, 10 p.c. less than in the previous year. However, market demand was good and prices remained high, giving record returns to the fishermen. The output of fishmeal on the Atlantic Coast during 1970 was also down by 12 p.c. The 80,000 tons of herring meal produced was 13 p.c. less and the 44,000 tons of groundfish meal produced was 6 p.c. less than in the previous year.

The Pacific salmon pack in 1970, at 1,423,476 cases, was 8 p.c. above the 1965-69 average annual pack. The pack of pink salmon (21 p.c. above average) and of chum salmon (90 p.c. above average) more than compensated for a reduced pack of sockeye, spring and coho. The export price of canned pink salmon remained the same as in 1969 but the export prices for the other three species were up more than 10 p.c.

### Subsection 1.—Primary Production

Landings for 1969 of all species of fish, both inland and sea (including such non-fish items as whales, seaweed, seals, bait worms, etc.), totalled more than 2,700,000,000 lb., having a landed value of \$178,400,000.

The value of the catch on the Atlantic Coast was \$115,500,000, an increase of 4.0 p.c. over the 1968 value of \$111,100,000. Of all species landed, lobster was the most valuable at \$29,500,000, followed by cod at \$21,600,000 and scallops at \$12,200,000. The value of the Newfoundland catch was up from the 1968 figure of \$28,000,000 to \$29,500,000 in 1969, the increase being accounted for mainly by the greater landings of catfish, haddock, flounder and sole, and herring. The value of the Nova Scotia catch reached a new high in 1969 at \$54,000,000. Lobster, at \$14,900,000, was the most important species from the standpoint of income to fishermen and scallops, at \$10,300,000, were second, followed by cod, haddock, swordfish, herring, and flounder and sole. New Brunswick fishermen also enjoyed a record catch, its value at \$15,900,000 being 2.5 p.c. higher than the 1968 value of \$15,500,000. The value of lobster increased from \$4,000,000 in 1968 to \$5,200,000 in 1969 to become the major source of income to New Brunswick fishermen. Herring was next at \$4,600,000,

followed by queen crabs at \$1,300,000. Returns to Prince Edward Island fishermen were also at a new high and lobster, at \$5,400,000, made up 71.0 p.c. of the total landed value of \$7,600,000. The Irish moss fishery was second at \$1,200,000 followed by scallops, cod, oysters and hake.

Quebec landings increased in value to \$9,100,000 from \$8,500,000 in 1968. The main species landed were cod valued at \$2,500,000, redfish at \$1,600,000, and lobster at \$1,600,000. The inland fishery in Quebec contributed about \$500,000 to the total landed value.

The landings of fish from the inland waters of Ontario, the Prairie Provinces, Yukon Territory and the Northwest Territories were, together, valued at \$15,000,000, an increase of nearly 22 p.c. over the \$12,300,000 of 1968.

British Columbia landings, at \$47,400,000, were again substantially lower in value than the all-time high of \$60,700,000 reached in 1966. This decrease was caused mainly by the large drop in the salmon landed on the Pacific Coast, which had a value of \$44,900,000 in 1968 but only \$27,800,000 in 1969. The disappearance of herring from British Columbia waters also contributed to the decrease.

### 1.—Quantity and Value of Sea and Inland Fish Landed, by Province, 1965-69

## Subsection 2.—Fish Products

According to commodity surveys conducted by Statistics Canada, the value of sea and inland fish products produced at all industrial levels, including the value to fishermen, amounted to \$389,930,000 in 1969, a figure little changed from that of 1968.

## 4.—Value of All Products of the Fisheries, by Province, 1965-69

Province or Territory	1965	1966	1967	1968 <sup>r</sup>	1969

ports.

<sup>2</sup> Includes landings by Canadian fishermen in United States

The annual output of canned salmon fluctuates considerably with the extent of the catch, as is shown in Table 6. This product has traditionally been the most important of the industry, but the demand for Atlantic Coast frozen groundfish fillets and blocks rose very rapidly in the 1960s and the value of these Atlantic products was higher than that of canned salmon every year from 1963 to 1966 and again in 1969.

**Section 2.—Governments and the Fisheries**

The Federal Government has full legislative jurisdiction over the coastal and inland fisheries of Canada, and all laws for the protection, conservation and development of these fisheries resources are enacted by the Parliament of Canada. The management of fisheries is, however, shared with provincial governments to which certain administrative responsibilities have been delegated.

The federal Department of the Environment exercises responsibility for the management of all fisheries, both marine and freshwater, in four East Coast provinces—Nova Scotia, New Brunswick, Newfoundland and Prince Edward Island—and in the Yukon and Northwest Territories. In four inland provinces—Ontario, Manitoba, Saskatchewan and Alberta—the management of all fisheries is conducted by the provincial governments. In Quebec, the provincial government manages both marine and freshwater fisheries, but the inspection of fish and fishery products produced for sale outside the province is carried

out by the federal Department of the Environment, as it is in all other provinces. In British Columbia, the fisheries for marine and anadromous (i.e., fish that migrate to the sea from fresh water) species are managed by the Department of the Environment, but the provincial government manages its freshwater fisheries. In the national parks across the country, the fisheries are managed by the Canadian Wildlife Service, Department of the Environment.

Licences for sport fishing in all provinces are distributed by the respective provincial government which retains all revenues so collected. Sport fishing licences in the Yukon and Northwest Territories are distributed by the federal Department of the Environment.

**Federal-Provincial Relations.**—The mutual interest of federal and provincial governments in fisheries problems is recognized in the undertaking of joint studies and programs, frequently on a regional basis. Regional committees established in recent years have brought together representatives of all governments concerned for periodic discussion. Four groups have evolved: the Federal-Provincial Atlantic Fisheries Committee consisting of representatives of the Federal Government and of the Governments of New Brunswick, Newfoundland, Nova Scotia, Prince Edward Island and Quebec; the Federal-Provincial Committee for Ontario Fisheries; the Federal-Provincial Prairie Fisheries Committee comprising representatives of the Federal Government and of the Governments of Alberta, Manitoba and Saskatchewan; and the Federal-Provincial British Columbia Fisheries Committee.

Members of the Committees are the Deputy Minister of the Environment of Canada and the Deputy Ministers of provincial departments responsible for fisheries. Sub-committees make recommendations for industrial development, research and marketing problems. The main committee in each case co-ordinates, where practicable, all activities in the respective fields of responsibility of its members and suggests to the respective government means of carrying out fisheries programs and projects of common concern. These include the development of methods and techniques in the catching of fish and of shore and plant facilities, and studies of the economics of fisheries to ensure that any proposed program of development is soundly based.

### Subsection 1.—The Federal Government

The work of the Federal Government in the conservation, development and general regulation of the nation's coastal and freshwater fisheries is performed, under the Minister of the Environment, by the Canadian Fisheries Service and two related agencies—the Fisheries Research Board and the Fisheries Prices Support Board. A brief outline of the functions of each of these agencies is given in this Subsection.

**The Canadian Fisheries Service.**—Canada's Fisheries Service, a component of the federal Department of the Environment, is responsible for the over-all management of the fisheries resources of the nation's coastal and inland waters. Jurisdiction over fisheries is exclusively federal under Canada's constitution, the British North America Act, 1867, although, as stated above, management responsibilities in fisheries have been delegated over the years to some provinces.

The Fisheries Service as now organized came into being on June 11, 1971, upon proclamation of the Government Organization Act 1970, which established the Department of the Environment as Canada's major national agency for combating pollution. The Department comprises the whole of the former Department of Fisheries and Forestry as well as environment-oriented elements of five other departments (see p. 142). The importance of the federal role in fisheries is emphasized in a clause of that Act designating the Minister of the Environment as also the Minister of Fisheries of Canada.

Two distinct but closely related elements are combined within the present Canadian Fisheries Service: (1) the operating branches of the former Fisheries Service of the Depart-

ment of Fisheries and Forestry, responsible for fisheries management and development programs; and (2) the Fisheries Research Board of Canada, concerned with research programs aimed at conserving and enhancing aquatic renewable resources and maintaining the biological fitness of the aquatic environment. In addition, several appointed public corporations and boards are involved in activities closely aligned with those of the Fisheries Service, including the Fisheries Prices Support Board, the Canadian Saltfish Corporation and the Freshwater Fish Marketing Corporation.

General direction of the Fisheries Service is provided by a small headquarters staff at Ottawa headed by the Assistant Deputy Minister, Fisheries Service, who acts also as Chairman of the Fisheries Research Board. Regional offices, administered by Regional Directors, are located at Vancouver, B.C., Winnipeg, Man., Quebec, Que., Halifax, N.S., and St. John's, Nfld.

**International Fisheries.**—Many of the deleterious effects of man on his aquatic resources are outgrowths of historical practice, insufficient knowledge, multiple uses of water, social and economic conditions, and national and international competition. Problems under national control are corrected as conditions warrant but many resources are shared with other nations and must be managed jointly.

Canada co-operates with many other nations in obtaining scientific data and formulating management proposals required to ensure the rational development and conservation of fisheries of common concern through membership in nine international fisheries commissions and one international council. These international organizations are established under the terms of formal conventions and assume responsibility for the investigation of specific living marine resources in the defined areas to which the terms of the respective conventions apply. Canadian representatives on these international bodies are appointed by Order in Council and include officials of the Department of the Environment and members of the fishing industry. Canada is a party to the following:—

- (1) the Convention between Canada and the United States of America for the Preservation of the Halibut Fishery of the Northern Pacific Ocean and Bering Sea;
- (2) the Convention between Canada and the United States of America for the Protection, Preservation and Extension of the Sockeye Salmon Fisheries in the Fraser River System (pink salmon added subsequently by protocol);
- (3) the International Convention for the High Seas Fisheries of the North Pacific Ocean;
- (4) the Interim Convention on Conservation of North Pacific Fur Seals;
- (5) the International Convention for the Northwest Atlantic Fisheries;
- (6) the Convention on Great Lakes Fisheries between Canada and the United States of America;
- (7) the International Convention for the Regulation of Whaling;
- (8) the Convention between the United States of America and the Republic of Costa Rica for the Establishment of an Inter-American Tropical Tuna Commission;
- (9) the International Council for the Exploration of the Sea; and
- (10) the International Convention for the Conservation of Atlantic Tunas.

Canada's membership in the International Pacific Halibut Commission dates back to 1923. It was the first international treaty signed by Canada on its own as an independent nation of the British Commonwealth. The terms of the convention between Canada and the United States provide for the development and maintenance of the maximum sustainable yield of halibut in the north Pacific Ocean and the Bering Sea. The Commission's headquarters is located at Seattle, Wash., where a scientific staff conducts investigations to provide data on which fishing regulations are based.

The International Pacific Salmon Fisheries Commission was established under a convention that dates back to 1930 between Canada and the United States for the protection, preservation and extension of the sockeye salmon fisheries in the Fraser River system. The convention was amended to include pink salmon in 1956. The Commission, with offices at New Westminster, B.C., is responsible for conducting studies of sockeye

and pink salmon in the convention area, regulating the fisheries and providing for apportioning the catch equally between fishermen of the two nations.

The International Convention for the High Seas Fisheries of the North Pacific Ocean came into force in 1953 with the exchange of ratifications between Canada, Japan and the United States. The purpose of the Convention is to ensure that fisheries of joint interest in the north Pacific Ocean are maintained at the level of maximum sustained productivity. The Commission, established under the terms of the Convention, maintains offices in Vancouver, B.C., and is responsible for promoting and co-ordinating scientific studies necessary to ascertain the conservation measures required to reach the objectives of the Convention and to recommend such measures to the contracting parties. This international fisheries Convention is unique in that it includes the "abstention principle", whereby a member nation abstains from fishing stocks that are being fully utilized by another member nation and meets certain other rigid qualifications.

The Fur Seal Treaty of 1911 between Canada, Japan, the Soviet Union and the United States is the earliest example of an international treaty established to provide for the conservation of a single marine species. The Treaty became inoperative during the early 1940s and a new Convention on Conservation of North Pacific Fur Seals came into force in 1957. A Commission, with headquarters at Washington, D.C., was established in 1958. Under the provisions of the Convention, commercial hunting of fur seals at sea is prohibited and the annual harvest is taken on the breeding islands. Canada and Japan do not participate in the annual hunt but each receives a share of the pelts taken by the Soviet Union and the United States. Scientific investigations are conducted to provide the data required to ensure that the fur seal populations are maintained at levels that will provide the greatest harvest year after year, with due regard to their relation to the productivity of other living marine resources of the area.

The International Convention for the Northwest Atlantic Fisheries, which came into force on July 3, 1950, provides for the investigation, protection and conservation of the fisheries of the northwest Atlantic Ocean to make possible the maintenance of a maximum sustained catch. Canada, Denmark, France, the Federal Republic of Germany, Iceland, Italy, Japan, Norway, Poland, Portugal, Romania, Spain, the Soviet Union, the United Kingdom and the United States are members of the Commission, which has its headquarters in Dartmouth, N.S. Major conservation measures adopted by the Commission have been related to minimum mesh sizes for trawl nets and to regulations for certain heavily fished stocks, including closed seasons and over-all catch limits. A scheme of international enforcement has been proposed to the governments of member nations whereby protection officers would be empowered to enforce conservation regulations adopted by the Commission not only for their own flag vessels but also for fishing vessels of other member countries.

The Convention on Great Lakes Fisheries between Canada and the United States came into existence in 1955. The Commission, with headquarters located at Ann Arbor, Mich., is responsible for formulating and co-ordinating research programs designed to determine measures needed to make best use of the fish stocks of common concern, recommending appropriate management measures and implementing a comprehensive program to eradicate or reduce the predator populations of sea lamprey found in the Great Lakes.

Canada has been a member of the International Whaling Commission since its inception in 1946. In order to conserve the important stocks of large whales in the world's oceans and provide for the orderly development of whaling activities, the Commission recommends scientific studies, determines the current condition of whale stocks and adopts regulations including open seasons, total catch quotas, closed areas and protected species. The members of the Commission include Argentina, Australia, Canada, Denmark, France, Iceland, Japan, Mexico, the Netherlands, Norway, Panama, South Africa, the Soviet Union, the United Kingdom and the United States. The headquarters of the Commission is at London, England.

In 1970, Japan joined Canada, Costa Rica, Mexico, Panama and the United States as a member of the Inter-American Tropical Tuna Commission which was established in 1950. The Commission conducts scientific investigations from its headquarters at La Jolla, California, to provide the data required to maintain the populations of yellowfin and skipjack tuna, as well as other species of fish taken by tuna fishing vessels in the eastern Pacific Ocean, at levels that permit maximum sustained catches. In recent years the main conservation regulation recommended by the Commission has been a catch quota for yellowfin tuna.

The International Council for the Exploration of the Sea was formed in 1902 to encourage and co-ordinate studies of the marine environment with particular reference to the living resources of the sea. Although the convention area includes the Atlantic Ocean and adjacent seas, the Council is primarily concerned with investigations conducted in the north Atlantic area. The seat of the Council is at Copenhagen, Denmark, and the member nations are Belgium, Canada, Denmark, Finland, France, the Federal Republic of Germany, Iceland, Ireland, Italy, the Netherlands, Norway, Poland, Portugal, Spain, Sweden, the United Kingdom and the Soviet Union. Canada became a member of the Council in 1967 and participates in co-operative oceanographic and biological investigations and in the annual scientific deliberations.

The first meeting of the International Commission for the Conservation of Atlantic Tunas was held in 1969 with representatives of Brazil, Canada, France, Ghana, Japan, Morocco, Portugal, South Africa, Spain and the United States in attendance. The Republic of Korea joined in 1970. The Commission has responsibility for studying the populations of tuna and tuna-like fishes in the Atlantic Ocean and its adjacent seas, and for making recommendations to the contracting parties concerning measures required to maintain the population of these fishes at levels that will permit the maximum sustainable catch for food and other purposes.

As evidence of its support for international consultation and co-operation in fisheries, Canada maintains active membership in the Committee of Fisheries of the Food and Agriculture Organization of the United Nations and in the Codex Alimentarius Commission which is concerned with world food quality standards.

In addition to co-operating with other nations to conserve high seas fisheries resources through international agreements, Canada has taken further action to protect the inshore fisheries in the coastal areas by establishing a 12-mile territorial waters limit and certain defined fishing zones. Canada excludes from these areas the fishing vessels of other nations except those having traditional fishing interests. Negotiations have been initiated with these latter countries to phase-out their fishing operations in Canada's Territorial Sea and Fishing Zones. Canada also enters into bilateral agreements as necessary to overcome specific fisheries problems.

**The Fisheries Prices Support Board.**—Established under the Fisheries Prices Support Act of 1944 (RSC 1970, c. F-23) the Fisheries Prices Support Board is responsible for investigating and, where appropriate, recommending government action to support prices of fishery products where declines are experienced. The basic principle of the legislation is to protect fishermen against sharp declines in prices and consequent loss of income due to causes beyond the control of the fishermen. The Board is responsible to the Minister of the Environment and consists of a chairman, who is a senior officer of the Fisheries Service of the Department of the Environment, and five members chosen from the fishing industry in the various fishing regions of Canada.

The Board has authority to buy quality fishery products under prescribed conditions and to dispose of them by sale or otherwise, or to pay to producers the difference between a price prescribed by the Board and the average price the product actually commands. The Board has no power to control prices other than its purchase policy nor has it any jurisdiction over operations in the fishing industry or the fish trade. Money necessary for dealings in fishery products is available to the Board from the Consolidated Revenue

Fund to a maximum amount of \$25,000,000 annually on recommendation of the federal Treasury Board and authorization of the Governor in Council.

Early in the year, the Government authorized the Board to continue a modified price stabilization program for frozen groundfish products. The program, in its conception, was designed to forestall distress selling in normal markets while ensuring fair returns to primary producers and processors. Since market conditions remained buoyant during the year, it was unnecessary for the Board to acquire product.

Programs designed to maintain stability in prices paid to yellow perch fishermen have been in effect since 1966. Under the 1970 program, the Board acquired slightly over 1,000,000 lb. of perch fillets at 40 cents a pound. All product was returned to suppliers by the end of the fiscal year at cost. The program, which added some stability to the marketing of this product during the initial mercury contamination difficulties, was operated without loss to the Government of Canada.

An Atlantic Queen Crab program was instituted during the fall months of 1970 to prevent distress sales of crab products, to provide temporary inventory financing and to stabilize the market for the Canadian product. By the time the program was operative, market conditions had improved with the result that the Board accepted inventory valued at \$92,000. The program and the consultations with the industry demonstrated to producers the necessity of producing a high-quality product and the difficulties involved in marketing a multitude of labels.

To ensure that the prices paid to fishermen for their 1970 production of salt codfish approximated those of the previous year, a deficiency payment program was authorized for the year. By the end of March 1971, funds had not been expended since the final settlement to fishermen by the Canadian Saltfish Corporation had not been established. It was expected that payments under this program would commence early in the 1971-72 fiscal year.

To assist in meeting food fish requirements for CIDA and the World Food Programme, the Board has acted as purchasing agent and supplier for canned and salted products. During 1970, the Board acquired, on its own behalf, 75,700 cases of mackerel for ultimate disposition through the World Food Programme. The Board also acted as purchasing agent for CIDA and the World Food Programme in acquiring an additional 339,203 cases of herring and mackerel.

To enable the Atlantic Coast groundfish exporters to plan and co-ordinate their production activities in relation to market requirements, the Board, through the facilities of the Marketing Branch of the Fisheries Service, began a market outlook service in the summer of 1970. The objective is to provide for the industry, at the commencement of the fishing season, a short-term supply and demand outlook for fillets and blocks of the major groundfish species. Demand outlook covers the potential level of United States consumption; the supply outlook is dealt with in terms of the major producers of groundfish such as Canada, Iceland, Norway, Denmark, Greenland, etc. The initial outlook is followed by periodic situation reports.

**The Freshwater Fish Marketing Corporation.**—This Corporation was established in 1969 (RSC 1970, c. F-13) for the purpose of marketing and trading in fish, fish products and fish byproducts in and out of Canada with the objective of ensuring more orderly marketing for the benefit of the whole fishery and achieving higher and more stable prices for the catch.

**The Canadian Saltfish Corporation.**—On Feb. 25, 1970, the House of Commons passed legislation (SC 1969-70, c. 32) authorizing the establishment of a corporation, the objects of which are to improve the earnings of primary producers of cured saltfish by buying and curing fish and by regulating interprovincial and export trade in both cured fish and byproducts of fish-curing. The Corporation, whose head office is at St. John's, Nfld., consists of a board of directors composed of a chairman, a president, one director for

each participating province and not more than five other directors, each of whom is appointed by the Governor in Council. It is assisted by an advisory committee of 15 members at least half of whom are fishermen or representative of fishermen. The limit of the Corporation's financial obligations is placed at \$10,000,000.

**The Fisheries Research Board of Canada.\***—The Fisheries Research Board is a research organization established by Act of Parliament (RSC 1970, c. F-24) for the purpose of conducting basic and applied research on Canada's living aquatic resources, their environment and their utilization. Its antecedents go back to 1898 and it is thus the lineal descendant of one of the oldest scientific organizations in Canada and one of the oldest government-supported research organizations under the supervision of an independent scientific board in North America.

The Board, which is under the jurisdiction of the Minister of the Environment, consists of a permanent chairman, who is appointed by the Governor in Council and who is a member of the Public Service of Canada, and "not more than eighteen other members" holding honorary appointments from the Minister of Fisheries for five-year terms; the Act requires that "a majority of the members of the Board, not including the chairman, shall be scientists, and the remaining members of the Board shall be representative of the Department (of the Environment) and the fishing industry". The scientific members are drawn principally from universities and research foundations across Canada, to include specialists in disciplines related to the Board's work. The industry members are selected from among

\* Revised by the Research and Development Branch, Canadian Fisheries Service, Department of the Environment, Ottawa.

*Several artificial spawning channels have been set up by the Canadian Fisheries Service to improve the survival of salmon and trout. The Noel Pauls Brook channel in Newfoundland has an impressive record of achievement, having produced an estimated 350,000 fry in 1971 to stock the Exploits River, which has the largest potential for Atlantic salmon on the Island.*

Canada's leading businessmen with an intimate knowledge of fishing and the fishing industry, and the Fisheries Service of the Department of the Environment representative is usually a senior staff member in Ottawa. Board members have both advisory and executive functions. The advisory functions are delegated in the first instance to regional Advisory Committees who conduct on-the-spot regional reviews and report to the Board on the operations and scientific programs with a view to their improvement. The executive functions are delegated to an Executive Committee elected from Board members and approved by the Minister.

The operations of the Board are designed to obtain the information needed for good management of the fisheries and other elements of the aquatic environment throughout Canada. Thus the Board's operations are highly decentralized, there being only a small administrative supervisory and publications staff in Ottawa. The responsibilities of the Ottawa office include planning and program co-ordination, and administration of a grant program to encourage university research in the fields of marine and aquatic science. The Board employs approximately 800 persons, of whom about 250 are scientists.

*Commercial and Recreational Fisheries.*—This program area is designed to add to fundamental knowledge concerning Canada's vast living marine and freshwater resources. Included are life history, population and behaviour studies leading to a sound scientific basis for the conservation and management of the commercially important fisheries including those for lobsters, crabs, shrimps, oysters, scallops, clams, marine mammals and other well-known economically important aquatic species of animals, such as salmon, cod, herring and halibut, as well as some marine plants, such as phytoplankton and seaweeds. Also included are studies in fish and shellfish diseases, fish predators and such basic studies as fish genetics, physiology and behaviour, the latter with a view to improving fish cultural and farming methods and also to improving fish farm and hatchery stocks. Besides these basic studies, new fishing grounds and new species for exploitation are sought and experiments in improving fishing methods are undertaken.

On the Atlantic Coast this work is conducted out of research stations located in St. Andrews, N.B., and St. John's, Nfld.; work on arctic fisheries and on sea mammals is directed from a laboratory situated in Ste. Anne de Bellevue, Que.; freshwater work is carried out from a station in Winnipeg, Man.; and work on the Pacific Coast is directed from research laboratories situated in Nanaimo, B.C. The Board operates 16 research vessels for its biological studies varying from small inshore and lake craft to specially built seagoing ships. The Board acts as Canada's research agent for three international fisheries commissions and two international sea-mammal commissions to which Canada is party.

*Aquatic Environment.*—This program emphasizes the study of the marine and freshwater environment in which aquatic organisms live. This is under continuing study to further knowledge in primary and secondary productivity and the occurrence of ocean and freshwater life of importance to man. Considerable importance is placed upon increased research efforts associated with pollution prediction, abatement and elimination, including the effects of freshwater and marine eutrophication. Encompassed here also are investigations into the distribution and physical and chemical characteristics of major ocean currents and the physical and biological structures of large ocean areas including the ocean bottom where concentrations of fish and other aquatic life occur. Ocean climate and ocean weather as they affect the distribution of fish and other living organisms, as well as the vertical and horizontal distribution of nutrient matter and the cycle of energy and life in the seas, are regularly observed and correlated. These studies, as well as special studies of interest to the Armed Forces, the Ministry of Transport and the international fishery commissions, are carried out by groups operating from Dartmouth, N.S., Winnipeg, Man., Burlington, Ont., and Nanaimo, B.C., with strong ship support from the Armed Forces and the Ministry of Transport, and with the co-operation of the Department of Energy, Mines and Resources.

*Products and Processing.*—Investigations are conducted toward improving methods of preserving, processing, storing and distributing fish products, as well as of utilizing all

parts of the fish. These include developments in refrigeration and the use of antibiotics as fish preservatives, improvements in canning, smoking and salting of fish, and the development of new products for the utilization of abundant species that are not now used for food. Fundamental studies of the structure and composition of fish proteins, marine oils, hormones from aquatic organisms and other products from the sea are under way.

These investigations are carried out on the Atlantic Coast at research laboratories situated at Halifax, N.S., and St. John's, Nfld. For inland products and processing, research is centred at Winnipeg, Man., and a research laboratory at Vancouver, B.C., undertakes investigation of Pacific Coast problems.

### Subsection 2.—The Provincial Governments\*

An outline of the work undertaken by each of the provincial governments in connection with administration of commercial and game fisheries is given in the following paragraphs.

**Newfoundland.**—The provincial Department of Fisheries in conjunction with the Newfoundland Fisheries Development Authority, a Crown corporation established in 1953, is concerned mainly with improvement and development of fishing and production methods. It conducts experiments and demonstrations in new designs of fishing gear as well as the modification of existing types, the construction of multi-purpose fishing craft and the exploration of potential fishing grounds with a view to increasing catching efficiency.

Loans are made to processors for the establishment and expansion of fish processing plants and for deepsea draggers. Aid to fishermen for the construction of modern vessels capable of a greater variety of fishing operations and larger production is provided by loans from the Newfoundland Fisheries Loan Board. The Fishing and Coasting Vessels Rebuilding and Repairs (Bounties) Act, 1958 authorizes financial assistance in maintaining and prolonging the life of the existing fleet. The Coasting Vessels (Bounties) Act, 1959 authorizes the granting, for locally built ships, of a maximum bounty of \$150 a ton for vessels of between 100 and 400 gross tons. The Fishing Ships (Bounties) Act, 1970 authorizes the payment of a bounty of \$200 per registered gross tonnage on boats 10 tons under deck up to 150 tons which are built under permit. An Inshore Fisheries Assistance Programme provides a bounty of \$10 a foot on boats measuring from 20 to 30 feet and \$12.50 a foot on boats measuring 31 to 35 feet. Bounties are also paid to fishermen on certain types of synthetic fibre fishing nets and lines.

Other services include advising fishermen on gear and equipment, industrial research, plant construction and engineering, and assistance to fishermen's unions. The Fisheries Salt Act, 1957 and the Fishing Salt Regulations, 1969 authorize rigid control over the sale and distribution of fisheries salt.

**Sport Fisheries.**—The inland waters of Newfoundland, although they provide excellent sport fishing, are not commercially exploited. The lakes and ponds actually remain under the authority of the Natural Resources Branch of the provincial Department of Mines, Agriculture and Resources but, under federal-provincial agreement, these waters, including rivers and streams, are under federal control in matters of conservation and guardianship.

**Prince Edward Island.**—The sea and inland fisheries of Prince Edward Island are administered by the Fisheries Service of the federal Department of the Environment. The provincial Department of Fisheries supplements federal activity in this area and is concerned principally with quantifying and, within the terms of the provincial role in fisheries management, maximizing returns, both social and economic, to those engaged in the fisheries industry. The Department provides technical assistance and, in conjunction with the federal fisheries organizations, engages in experimental and developmental work in such fields as fishing methods, resource inventories, statistical studies and management assistance.

\* Prepared by the respective provincial departments responsible for fisheries administration.

Loans are made available to fishermen and the fishing industry through the Prince Edward Island Lending Authority, a Crown corporation established in 1969 which is empowered to grant credit in the sectors of fisheries, industry, tourism and agriculture. The provincial responsibilities in the area of freshwater fisheries are discharged by the Fish and Wildlife Division of the Department of Tourist Development.

**Nova Scotia.**—Although the Federal Government has exclusive jurisdiction over the marine and inland fisheries of Nova Scotia and attends to all phases of administration related thereto, the Nova Scotia Government operates in several fields where provincial initiative is found to be necessary and appropriate, having regard for the importance of the fishery resources in terms of employment, industry, trade and recreation.

In the commercial fisheries, provincial government interests are the concern of the Nova Scotia Department of Fisheries. The Fishermen's Loan Board is administered by that Department and the Industrial Loan Board by the Nova Scotia Department of Development; the first makes loans to fishermen for the purchase of boats and engines and the second makes loans for the construction or improvement of fish processing plants. Fisheries engineers perform inspection and survey duties for the Loan Boards and provide technical assistance and advice to loan applicants and others in the fisheries and allied industries, notably the boatbuilding industry. Instructors conduct courses for fishermen in the care and maintenance of marine engines, in basic navigation and in the design, construction and maintenance of gear. The on-course instruction is supplemented frequently by informal on-the-spot assistance to smaller groups who find themselves in need of technical help with particular problems. The Nova Scotia Department of Fisheries, with the financial and technical assistance of the Fisheries Service of the federal Department of the Environment, organizes and conducts explorations of fishing grounds for new resources and studies and introduces new, improved gear and methods to the industry. Recently, work has been carried out on "off-bottom" methods of rearing oysters and mussels. An oyster hatchery went into production in 1971 which will also facilitate studies and rearing trials with other shellfish species.

**Sport Fisheries.**—In recent years, Nova Scotia, through the Wildlife Conservation Division of its Department of Lands and Forests, has spent a considerable amount of money on management and research in certain lakes and streams in the province with a view to aiding the Atlantic salmon and trout fishery. A continuing program of lake and stream investigations was begun in 1961 in order to obtain information useful in the formulation of a fish management program for the future. A system of rearing ponds, capable of producing 100,000 yearling speckled trout annually, has been established on the Moser River in Halifax County. Several projects dealing with reclamation, farm ponds, rainbow trout and smallmouth bass are also being conducted. A full-time fisheries biologist is employed by the Division.

The Nova Scotia Department of Tourism has been promoting saltwater sport fishing by arranging, in conjunction with the provincial Department of Fisheries and the federal Department of Manpower and Immigration, a series of courses for captains contemplating the establishment of charter services, awarding prizes to sportsmen with the largest tuna and bass catches of the season, sponsoring the International Tuna Cup Match and the Intercollegiate Game Fish Seminar and Match, and publishing a brochure listing charter boats available in the province.

**New Brunswick.**—Commercial fishing is one of the most important basic industries of New Brunswick, employing about 6,200 fishermen with annual earnings of \$16,000,000 and 3,000 plant workers. The annual marketed value of fish products is about \$65,000,000, of which 90 p.c. is exported to the United States. New Brunswick's commercial fisheries, both tidal and inland, are under the legislative jurisdiction of the federal Department of the Environment; angling in Crown waters is the responsibility of the provincial Department of Natural Resources.

The New Brunswick Department of Fisheries and Environment has five Branches. The *General Administration Branch* is responsible for the planning, organization and control of all general administrative services of the Department, including program formation, financial administration, personnel management and public relations. Close liaison is maintained with other federal and provincial departments and agencies concerned with the fishing industry of the province.

The functions of the *Boatbuilding and Maintenance Branch*, with a personnel consisting of marine engineers, a naval architect and boat inspectors, include the study, modification and approval of plans and specifications of the numerous types and classes of fishing vessels employed in the fisheries of the province as well as the inspection of vessels financed by the Fishermen's Loan Board. New designs are being introduced, the trend being toward larger combination multi-purpose vessels. Under the leadership of the experienced staff of this Branch, New Brunswick fishermen are now operating a fleet geared for diversified operation, permitting the inexpensive and easy conversion from one fishery operation to more lucrative operations throughout the season. A 600-ton-capacity marine railway dry dock constructed in 1968 at Bas Caraquet serves the offshore fishing fleet of northeast New Brunswick and a 200-ton transfer system adjacent to the dry dock provides winter lay-up and repair facilities for smaller vessels. Nearby shipbuilding and repairing facilities provide ready and adequate service to an expanding offshore fleet.

The *Exploratory Fishing and Education Branch* continues the experimental and exploratory fishing and fish processing projects that have been carried on for many years in co-operation with the (now) federal Department of the Environment. Technical and financial assistance are made available to the New Brunswick Department of Fisheries and Environment for projects undertaken toward modernizing fishing and processing methods, experimenting with new types of fish-catching equipment and demonstrating its operation to fishermen, and exploring and developing hitherto unexploited or under-exploited species of molluscs, crustaceans, fishes and seaweeds. This work has resulted in the establishment of snow crab, shrimp, Irish moss, tuna and eel fisheries in New Brunswick.

During 1971-72, 14 fisheries development projects were undertaken on a shared-cost basis with the federal Department of the Environment. A survey of the mollusc resources of eastern and northern New Brunswick located 11 surf clam beds and one ocean quahaug bed in shallow waters and their commercial importance is under investigation. The study also considered the feasibility of expanding the soft-shell clam and mussel industries and the limited exploitation of welk, following the discovery of suitable concentrations of these resources. The Branch has been involved in the management of the oyster resource of the Buctouche region of Northumberland Strait, one of the best oyster seed producing areas in the Atlantic area. The Bay of Fundy coast revealed commercial concentrations of rockweed from which industrial alginates are extracted; the estimated standing crop of 53,000 tons can provide a sustained harvest of 6,000 tons a year. Irish moss, which contains a colloid with wide industrial applications, has also been found in commercial quantities in several areas of northern New Brunswick. Types of fishing gear are being tested to improve the catchability of northern pink shrimp in Atlantic waters and refrigeration systems are being adapted for installation on shrimp vessels. Extensive areas of the Gulf of St. Lawrence are being explored to determine the extent of the capelin and sardine resources. An inshore mackerel fishery using the latest developments in purse-seining techniques is being developed in Northumberland Strait with the use of small inshore vessels. Surveys are under way to determine the commercial significance of the small rock crabs along the coast and incentive is offered for their exploitation.

The Branch operates a School of Fisheries at Caraquet where, in the 1970-71 academic year, 296 fishermen took training in the various phases of their trade. The School teaches navigation, administration, marine biology, oceanography, radiotelephone, metal- and wood-working, arithmetic and languages, and graduates may receive practical training aboard large modern fishing vessels under a joint federal-provincial program of technical upgrading. Following a few weeks of training, apprentices are taken on as regular crew members.

The *Fish Inspection and Marketing Branch* administers the New Brunswick Fish Inspection Act and Regulations, although, for greater effectiveness and to avoid duplication of personnel, 30 fish inspectors of the Fisheries Service of the federal Department of the Environment, Maritimes Area, carry out their application. The Branch is active in promoting the expansion and modernization of existing fish processing plants and the establishment of new plants in the province. Its efforts are aimed at studying existing markets and developing new ones for fishery products at home and abroad in collaboration with other government agencies, federal and provincial. Emphasis is placed on promoting the consumption of fishery products within the province, on the development of new products for domestic and export markets, and on the training of plant personnel in management and production controls.

The *Fishermen's Loan Board of New Brunswick*, a body corporate operating under the jurisdiction of the Minister of Fisheries and Environment, was established in 1946 and now operates under the Fishermen's Loan Board Act of 1952 and the regulations of Nov. 1, 1963. Its function is to improve and develop the fishing industry of the province by providing adequate financial assistance to individual fishermen, groups, associations, processing firms and corporations, at a moderate rate of interest to construct modern fishing vessels, make major repairs and purchase engines and equipment. Since its inception, the Board has granted 2,244 loans to New Brunswick fishermen for a total of over \$30,175,000; outstanding loans amounted to \$12,788,168 in 1970.

Loans are repayable within a five-year period on small inshore fishing vessels; repayment schedules on large trawlers may extend to 15 years, based on the gross proceeds of the catch. Most of the new fishing vessels being built for fishermen and fish processing firms in the province are financed by the Board. The Board acts as agent for the federal Department of the Environment financial assistance program granted to owners of new fishing vessels that are not eligible for the shipbuilding subsidy granted by the Department of Industry, Trade and Commerce.

*Sport Fisheries.*—Sport fishing contributes substantially to the economy of the province. Great Atlantic salmon rivers like the Miramichi, the Restigouche and the Saint John are known around the world for their prolific production of this majestic game fish and attract many thousands of tourists to the province each year. Anglers catch as many as 50,000 salmon a year in the Miramichi system alone. Many other species are also sought after by both residents and non-residents in the hundreds of streams, rivers and lakes of the province.

**Quebec.**—The sea fisheries of Quebec are administered by the Fisheries Branch of the Quebec Department of Industry and Commerce, which carries on its functions through three Divisions—Research, Economics, and Technical Services. The *Research Division* is involved in experimental work and study on the biological aspects of commercial fish species, on the processing of seafoods for marketing, and on the testing of new types of fishing gear. The work of the Biological Service of the Division is facilitated by the availability of extensive research equipment at the Marine Biology Station in Grande Rivière and at the new government science complex at Ste. Foy in suburban Quebec.

One of the main functions of the *Economics Division* is to administer the loan program, which applies to construction and repair of boats, as well as to administer other forms of government assistance. In 1971, the active offshore fishing fleet included three 166-foot and three 129-foot steel trawlers, two 125-foot trawlers, one 100-foot dragger, six 87-foot trawler-seiners, seven 87-foot wooden trawlers, 14 82-foot steel trawlers, 74 60-to-65-foot wooden trawlers and 48 45-to-54-foot "gaspésiennes" and long-liners. As at Mar. 31, 1971, owners of these fishing vessels held outstanding government loans, for both construction and repair, totalling nearly \$10,000,000. This represents an improvement of some \$2,000,000 over the situation of a year earlier. The Economics Division also carries out socio-economic analyses which are necessary to the government in planning action in the field of fisheries and in ensuring the efficiency of development projects.

The *Technical Services Division* conducts regular inspections of fishing vessels, keeps close supervision over the operations of maintenance and repair crews and also supervises the tenders submitted to fishermen by shipyards or other suppliers. Its protective service issues fishing permits, conducts land and sea patrols and investigates infractions of regulations. The Division includes an Engineering Service which draws up plans and specifications related to improvements in fishing equipment and a Refrigeration Service which administers Fisheries Branch equipment, including 39 cold storage warehouses with a daily freezing capacity of 500 tons and a storage capacity of 25,000,000 lb.

Fisheries Branch administration is centralized in Quebec City, with offices in the main fishing centres. In co-operation with the Department of Education, it conducts a training program for fishermen and producers for which it maintains a fisheries school and a training vessel brought into service in June 1968. The Department of Industry and Commerce works closely with the Quebec Planning and Development Board and with the Eastern Quebec Regional Administrative Conference in the administration of various development programs, one of which is a training program designed to advance the domestic use of seafoods.

*Sport Fisheries.*—Sport fishing in the inland waters of Quebec is under the jurisdiction of the Department of Tourism, Fish and Game, which employs 417 full-time wardens and issues the required sport-fishing licences. Four hatcheries are maintained by the Department, where speckled trout, brown trout, rainbow trout, grey trout, ouananiche, maskinonge and salmon are reared for the restocking of lakes and streams.

Excellent fishing may be found in all provincial parks and reserves. Gaspé and Laurentide Parks are renowned for trout fishing, and the waters of Chibougamau Reserve and La Vérendrye Park, situated on the height of land, abound in pickerel, pike and grey trout. Eleven salmon rivers are open to anglers—the Petit Saguenay, the Laval, the Moisie, the Matane, the Cap Chat, the Ste. Anne, the St. Jean, the Matapédia, the Dartmouth, the Port Daniel and the Petite Cascapédia.

A committee made up of directors of the Quebec Wildlife Federation makes recommendations to the provincial government concerning legislation required for the maintenance of satisfactory fishing conditions and other problems arising out of the ever-changing conditions of modern life and their effect on the wildlife of the province.

**Ontario.**—The fishery resources of Ontario are administered by the Commercial Fish and Fur Branch and the Sport Fisheries Branch of the Department of Lands and Forests, under the authority of the federal Fisheries Act, the Fishery Regulations for the Province of Ontario, the Ontario Game and Fish Act and the Regulations connected therewith.

*Commercial Fisheries.*—The commercial fishing industry in Ontario provides employment for about 1,900 commercial fishermen and 4,000 bait fishermen directly and for many more indirectly. The industry, with a capital value of over \$12,000,000, produces an annual yield of from 55,000,000 lb. to 72,000,000 lb. of fish, which includes more than 9,000,000 lb. of bait fish and has a market value of from \$15,000,000 to over \$18,000,000. The industry, although widely scattered throughout the province, is centred chiefly on the Great Lakes, particularly Lake Erie. The species taken commercially include perch, smelt, whitefish, pickerel, lake trout, white bass, pike, herring, chub, sheepshead, carp, catfish and bullheads, sturgeon, eel, goldeye, rock bass, sunfish and suckers. More than 250 smaller inland lakes are commercially fished, mainly those in the northwestern portion of the province, and careful management of these lakes is essential to ensure continued production.

The types of fishing boats in use vary from small craft to 70-foot tugs, and types of gear vary from gill-nets, pound-nets and trap-nets, seines, trawls and baited hooks to small hand-operated seines and dip-nets. Fishing methods and equipment have been modernized extensively during the past few years. Diesel-driven steelhull tugs with depth-sounding devices, radar and ship-to-ship and ship-to-shore communications have been in use for some time. Knowledge of the fish and their movements is constantly being expanded

from biological research findings. Modern icing facilities and transportation methods are in use as well as new types of fishing gear. Trawling has proved very efficient in harvesting smelt on a year-round basis in Lake Erie.

Most Ontario fishermen are organized into various local associations and many of these associations are, in turn, represented by the Ontario Council of Commercial Fisheries, which performs important services to the industry.

*Sport Fisheries.*—Having an estimated freshwater area of approximately 68,490 sq. miles, Ontario is one of the most attractive fishing areas on the Continent. Excellent angling opportunities are available for such prized fish as brook, rainbow and lake trout, yellow pickerel (walleye), smallmouth and largemouth bass, northern pike and maskinonge. The recreational angling fraternity is no longer restricted to open water—it is now a year-round game. In many stores and camps throughout the province, a wide selection of ice-angling equipment, including snowmobile rentals, is available to the fisherman and seasons have been extended in many parts of the province for certain species of fish to facilitate winter angling. Annual revenue from the sale of angling licences prior to 1971 was in the neighbourhood of \$6,000,000; as of the 1971 summer season, licences are no longer required of residents but an annual fee of \$8.50 is payable by non-residents for fishing privileges. The management of this valuable resource is administered by a field staff of well-trained conservation officers and biologists located in 21 forest districts of the province.

*Provincial Hatcheries.*—Ontario operates 16 fish hatcheries and rearing stations; the main species reared include brook trout, rainbow trout, lake trout, splake, smallmouth and largemouth bass and maskinonge. The basic aim of the hatcheries is the economic production of high-quality species to sustain and develop recreational fishing throughout the province. Research is conducted on the improvement of transportation and planting techniques to ensure maximum survival and returns to the angler; such transportation includes the use of aircraft, helicopters and trucks. The marking of hatchery fish by removal of a single fin is providing valuable information on survival of fish stocks and angler success.

*Manitoba.*—Manitoba's interior location belies the importance of its fisheries resources which stems from an abundance of fresh water in about 40,000 sq. miles of lakes and streams covering 16 p.c. of the area of the province. The traditional utilization of these resources for commercial, sport and domestic purposes was unfortunately adversely affected during 1970-71 by mercury contamination of fish, first discovered in Manitoba waters in December 1969. Commercial fishing was discontinued in Lake Winnipeg, Cedar Lake and the Saskatchewan River at the commencement of the summer season and on June 12 at Split and Sipiwesk Lakes in northern Manitoba. Financial assistance programs, cost-shared with the Federal Government, were arranged for the affected commercial fishermen. Angling was permitted in all waters although warnings were issued. The harvest of fish by many native people for local use also declined.

The commercial fishery in the year ended Mar. 31, 1971 produced 14,100,000 lb. of fish, a 34-p.c. decrease from the 21,400,000 lb. of the previous year. The value to the fishermen declined \$1,200,000 to \$2,100,000. Northern waters contributed 6,300,000 lb. (45 p.c.), followed by Lake Winnipegosis with 3,500,000 lb. (25 p.c.) and Lake Manitoba with 3,300,000 lb. (23 p.c.). The production from Lake Winnipeg was only 400,000 lb. (3 p.c.), a decline of 5,300,000 lb., because the only commercial fishing permitted was for mink feed by local ranchers. Sixteen species or groups of species normally enter into the commercial catch but only a few species predominate. In 1970-71, whitefish contributed 3,800,000 lb., pike 2,500,000 lb. and walleye (pickerel) 2,300,000 lb. A miscellany of species but primarily suckers and carp contributed 4,800,000 lb. All of the commercial catch is marketed by the Freshwater Fish Marketing Corporation, a federal Crown agency, and is exported mainly to the United States. Gill-nets are the main fishing gear. About 1,240 fishermen operated during the open-water fishing and 1,400 took part in winter fishing.

Fish farming using rainbow trout in "pothole" lakes was started on a commercial basis but the results did not meet expectations. A new plan for commercial bait fishing was also inaugurated.

Fisheries administration is under the control of the Department of Mines, Resources and Environmental Management and is divided into research, planning and operations sectors. The operations sector is divided into Headquarters and four regional units. Conservation officers enforce both the commercial and the angling regulations and carry out numerous other duties in connection with fisheries management. Professional biologists carry out a continuing program of studies which not only monitor the resource but also extend the knowledge of it. Fish culture plays an important role in fisheries management. Pickerel hatcheries are located on Lakes Winnipegosis and Manitoba. Lake Winnipeg has two hatcheries, one at Dauphin River and the other at Grand Rapids. A trout hatchery is located in the Whiteshell Provincial Park. Two temporary facilities for collection of spawn are also used.

*Sport Fisheries.*—The sport fishery is an important use of the fishery resource, with walleye, pike, perch and several kinds of trout being the principal sport species. A total of 117,382 angling licences were sold in 1970-71 of which 90,979 were purchased by residents of Canada. An increase in fees and the discovery of mercury contamination in fish probably was responsible for a decline of 13,504 in the number of licences sold from the previous year.

**Saskatchewan.**—Approximately 32,000 sq. miles of water, about one eighth of Saskatchewan's area, provide the basis for a fishery resource that contributes much to the economic and recreational activity of the province. The Fisheries Branch of the Department of Natural Resources, with head office at Prince Albert, administers the fisheries. The Branch has three main Divisions—Management, Research and Fish Culture—which are responsible for planning policies; developing programs to ensure the proper management and utilization of the fishery resource; interpreting and explaining policies, programs and regulations; administering the Acts and Regulations (both federal and provincial); and adapting regulations to meet changing conditions. The objective is to encourage efficient multi-use of the fishery, taking into consideration the interests of the various groups concerned—commercial fishermen, mink ranchers, anglers and the public generally.

In 1969-70 the Saskatchewan commercial fishery harvested approximately 14,000,000 lb. of fish, having a landed value to the fishermen of \$2,300,000 and a market value of \$4,600,000. In addition, a commercial harvest of 210,000 lb. of brine shrimp and brine shrimp eggs was taken from several saline lakes in southern Saskatchewan. These are processed for sale to fish hobbyists. Although low fur prices continued to exert a depressing influence on mink ranching in Saskatchewan, 21 ranches in 1969 harvested approximately 2,100,000 lb. of fish to feed 3,437 breeding animals.

The Fish Research Division conducts biological surveys on most of the large lakes and on many smaller water bodies and streams in the province to provide information for the development of fisheries management policies and programs. The current program is designed to determine productivity of water bodies, secure information on abundance and relationship of fish species, investigate ecology and assess factors affecting environment of fish, develop techniques to achieve maximum harvest of fish populations without prejudice to continued production, and develop techniques to facilitate rehabilitation and stocking of small water bodies. Limnological and fisheries investigations are continuing on recently established reservoirs on the South Saskatchewan River, including Lake Diefenbaker. The long-term creel census on Lac la Ronge is being supplemented by an intensive investigation of the life history and ecology of northern pike. Additional creel censuses are also under way on Nemeiben Lake, Puskwakau River and the Qu'Appelle Lakes.

The provincial hatchery at Fort Qu'Appelle reared over 28,000,000 fish in 1969 for stocking in 132 waters.

*Sport Fisheries.*—Saskatchewan continues to produce some of the finest sport fishing in Canada, as evidenced by the increasing number of anglers licensed. In 1969, a record

total of 143,579 angling licences were sold, representing a 10-p.c. increase in sales over 1968. As in previous years, outstanding numbers of northern pike, lake trout, walleye, brook trout, brown trout and rainbow trout were taken.

A continuous program of inventory and examination of sport fishing stocks is maintained by the Management Division of the Fisheries Branch. During 1969, 249 waters were examined. The stocked game trout program continues to grow in popularity; to date, 33 lakes and 40 streams and rivers have been stocked with various species of trout and salmon.

**Alberta.**—Commercial and sport fishing are administered by the Fish and Wildlife Division of the Department of Lands and Forests, under the authority of the Fisheries Act (Canada) and the Fish Marketing Act (Alberta). Production of commercial fish from Alberta's 6,485 sq. miles of fresh water for the year ended Mar. 31, 1970, was 10,805,771 lb. Although this quantity was slightly lower than that in the previous year, the landed value of the catch was \$1,017,162 as against \$932,940 in 1968-69 and the marketed value was \$1,727,743 compared with \$1,466,370. Lake whitefish is the most valuable commercially caught fish; it accounted for 56 p.c. of the total marketed value but represented only 22 p.c. of the total landings. Production of tullibee (cisco), primarily used for animal food, remained in second place in value among the fish marketed. Other species taken, in order of marketed value, were pike, walleye (pickerel), perch, ling, suckers, lake trout and goldeye. A good part of the quantity taken is marketed outside the province, mainly in the United States.

*Sport Fisheries.*—There were 148,337 angling licences sold in Alberta in 1970-71, of which 145,491 went to resident and non-resident Canadians and 2,846 to non-resident non-Canadians. A new licence, designated the Trophy Lake Licence, was instituted as a requirement to fish seven specified lakes which are being managed to produce large or trophy-size sport fish.

In 1970, a total of 177 lakes and streams were stocked with 5,686,000 fish and fish eggs; 61 p.c. were rainbow trout, 22 p.c. walleye eggs and 17 p.c. cutthroat and eastern brook trout, kokanee, perch, pike and coho salmon. Coho salmon were introduced to Cold Lake to establish a population for sport fishing; the success of this experiment will be known in late 1971 when the mature salmon will return to their nursery stream. Licences sold for game fish farming, for both private and commercial purposes, numbered 130 in 1970 compared with 26 in the previous year. Rainbow trout is the major species raised.

Sport fisheries in Alberta are administered on a regional basis, with six fisheries biologists located in various centres of the province and responsible for a delineated geographic area. Each biologist is assisted by one or more technicians. In addition to the regional staff, there is a Research Section composed of two biologists and a technician, and a Pollution Section consisting of one biologist and a technician located in Edmonton.

**British Columbia.**—A Fisheries Office, which was organized in 1901-02 and became very active in fish culture work, building and operating fish hatcheries and instituting scientific research into various fishery problems, was superseded in 1947 by the Department of Fisheries which in turn was superseded in 1957 by the Department of Recreation and Conservation. Today, the Commercial Fisheries Branch of the Department of Recreation and Conservation is the provincial organization concerned with commercial fisheries. Broadly speaking, the administrative and regulative jurisdiction over the fisheries of British Columbia rests with the federal authority. The ownership of the fisheries in the non-tidal waters is vested in the Crown in the right of the province, as are the shell fisheries such as oyster fishing and clam fishing in tidal waters. The province administers these fisheries although the regulations covering them are made under federal Order in Council on the advice and recommendation of the province.

The provincial Fisheries Act provides for the taxation of the fisheries and, under civil and property rights, for the regulation and control of the various fish processing plants

under a system of licensing. The commercial harvesting of oysters and marine aquatic plants is regulated by provincial permits and licences. Provision is also made for arbitration of disputes regarding fish prices that may arise between the fishermen and operators of the various licensed plants. The administration of the Act involves the collection of revenue and the supervision of plant operations.

Regulation and administration of net fishing in the non-tidal waters of the province, including commercial fishing and authority for regulation of the game fisheries in non-tidal waters, is vested in the Fish and Wildlife Branch which operates a number of trout hatcheries and egg-taking stations for re-stocking purposes.

The Branch co-operates closely with the Fisheries Research Board of Canada. The biological research into those species of shellfish over which the province has control, principally oysters and clams as well as marine plants, is conducted by the Fisheries Research Board of Canada at the Pacific Biological Station, Nanaimo, B.C., under agreement with the federal and provincial authorities. The object of this research is to encourage the industry to produce better products more economically and to enable the Commercial Fisheries Branch to regulate the various species so that maximum exploitation may be obtained on a sustained-yield basis.

### PART III.—FURS

#### Section 1.—The Fur Industry\*

The value of raw furs produced in Canada in the 1969-70 season amounted to \$34,766,389. Ranch-raised furs accounted for \$18,881,237 (54.3 p.c.) of this total and wildlife pelts for \$15,885,152 (45.7 p.c.). The value of the 1969-70 production was approximately 15 p.c. below the 1968-69 output. This decline was due in part to lower values for wildlife pelts, but the principal reason was the weaker market for ranched mink wherein the average price realized per pelt was approximately 23 p.c. below the 1968-69 average.

**Fur Trapping.**—Trapping is carried on in all the provinces and territories, the principal producers in 1969-70 being Ontario (22.7 p.c.), Alberta (15.1 p.c.), Manitoba (13.2 p.c.) and Quebec (10.7 p.c.). Beaver was again by far the most important fur bearer, the production of 433,408 pelts worth \$6,540,378 accounting for 41 p.c. of the total value of the wild fur catch. Conservation measures, including re-stocking depleted areas with beaver from other parts of the country, have been instrumental in maintaining the numbers of this fur bearer. In 1969-70 the principal producers of beaver pelts were Ontario (36.9 p.c.), Quebec (17.9 p.c.), Alberta (13.6 p.c.), Manitoba (9.9 p.c.) and Saskatchewan (9.2 p.c.).

In all the important trapping areas the numbers of the wild fur bearers are being well maintained and even with today's extensive output from fur farms, fur trapping accounted for almost half of the total value of the Canadian raw fur production in the 1969-70 season. The main trapping areas are in the northern parts of the provinces and in the Northwest Territories and the Yukon Territory where most of the trapping is done by the native population. The trapping of fur bearers continues to be an important source of revenue for many of these people, although a growing number are turning to more attractive alternative employment where this is available.

Fur trapping is a primary, seasonal industry and the economic factors that affect the industry in Canada are common to trapping in most other fur producing countries. The income of trappers is dictated by the volume of the catch and by the prices obtained for the catch. Both production and prices are subject to rather wide variations and returns to trappers fluctuate considerably from year to year. Production, governed by biological and other natural factors, is subject to cyclical fluctuations and cannot be readily controlled. Similarly, the market for furs is a fashion-oriented world market in which the determination of prices is largely beyond the influence of the trapper. The drastic decline in the demand

\* Prepared by the Fur Unit of the Production and Marketing Branch, Canada Department of Agriculture, Ottawa.

and consequently in the price realizations for long-haired furs, which prevailed throughout the 1950s, is a particularly outstanding example of the effects of style changes.

**Fur Farming.**—The raising of wild fur-bearing animals in captivity for their pelts has been carried on in Canada for many years; in the 1969-70 season, pelts produced on farms accounted for 54.3 p.c. of the value of the Canadian fur production. The industry is carried on in all provinces, the principal producers being Ontario (32.8 p.c.), British Columbia (21.4 p.c.), Manitoba (12.8 p.c.) and Alberta (11.0 p.c.).

**Mink.**—The rather brief history of mink farming records a steady growth in this industry from its beginnings in the early 1900s; the following figures depict the recent growth:—

<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>	<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>
	No.	\$		No.	\$
1930.....	3,284	10.52	1966.....	1,810,661	12.41
1940.....	229,202	9.64	1967.....	1,967,323	11.58
1950.....	589,252	17.08	1968.....	1,667,945	13.60
1960.....	1,203,853	14.03	1969.....	1,778,737	10.48
1965.....	1,624,154	17.41	1970.....	1,494,394	9.65

The development of mink farming in Canada was paralleled and in some instances exceeded in a number of other countries, and by 1965 the world output amounted to around 23,000,000 pelts annually. Throughout this period, consumer demand for mink kept pace with and sometimes surpassed the expanding production, and carryovers of unsold mink pelts at the auction level, from one season to another, were virtually unknown. From 1966 onward, the ability of the world market to absorb the increasing annual production became less assured and, in the later 1960s, average realizations for most types of mink declined to the point where producers were unable to recover their costs. The weaker market may be attributed to a number of factors, the most important of which is that, after many years of expansion, the demand for mink in present markets (notably North America and continental Europe) appears to have levelled off. As a result of the unfavourable returns, a number of mink farmers in North America and Europe have ceased operations in recent years. For the immediate future the resulting decline in the number of pelts available might put fresh life in the market, but over the longer term there is a pressing need to develop new markets for this product.

**Chinchilla.**—In 1969, Alberta was the principal producer of chinchilla pelts followed by Ontario, British Columbia and Saskatchewan. The following figures show the production, average prices and the number of farms in recent years:—

<i>Year</i>	<i>Pelt Production</i>	<i>Average Realization</i>	<i>Farms at Dec. 31</i>
	No.	\$	No.
1955.....	1,742	27.50	669
1960.....	9,067	13.06	531
1965.....	17,109	13.18	556
1966.....	19,133	11.88	653
1967.....	17,368	11.11	937
1968.....	18,854	9.97	1,395
1969.....	18,664	9.15	1,615

In recent years the number of chinchilla farms has increased sharply, due in part to the unwarranted promotion of chinchilla raising as an easy and profitable undertaking by inexperienced persons. Many of the new breeders lack experience in the management of chinchillas and the lower average pelt prices registered in recent years reflect, to some extent, this inexperience.

**Fox.**—In 1970, there were 1,255 fox pelts having an average value of \$31.19 produced on 45 Canadian farms. The principal producers were Ontario, New Brunswick and Prince Edward Island. Fox furs are currently popular in all markets but their use is mainly for garment trimming and there are no indications that fox farming is likely to increase in importance in this country in the foreseeable future.

**Fur Marketing.**—The value of the Canadian fur crop in recent years has ranged between \$35,000,000 and \$40,000,000 and export markets are of major significance in the sale of these furs; about 83 p.c. of the 1969-70 season's production of raw furs was exported, the principal species exported being ranched mink, beaver, hair seal and muskrat. The most important customers were the United States, the United Kingdom, Switzerland and the Federal Republic of Germany.

Most of the world's furs continue to be sold at auction and, in the peak selling period, buyers from other countries frequently make the auction circuit, attending sales in Montreal, North Bay, Winnipeg, Edmonton and Vancouver. Canadian furs are generally sold in the raw state, to facilitate entry into the many countries that maintain tariffs on imports of dressed furs. Even in this press-button age, it is difficult to reduce the amount of manual work that is involved in preparing fur skins for the market. At the auctions the furs are graded, pelt by pelt, and placed in lots, carefully matched as to size, colour and quality. Prior to the auctions these lots are inspected by buyers who examine the skins and record their impressions of values upon which their bids will be based at the time of the auction. The emphasis on hand-work carries right through to the finished garment.

## Section 2.—Fur Statistics

### Subsection 1.—Fur Production and Trade\*

**Total Fur Production.**—Annual figures of raw fur production are based on figures of royalties, export taxes, etc., provided by the game departments of all provinces except Prince Edward Island; those for Prince Edward Island are based on returns by fur dealers in that province. Table 1 shows the fluctuating trend of the fur industry over the past decade. It should be mentioned that, from 1965 on, the figures include hair and fur seal pelts, which in 1970 had a value of \$2,348,863.

**1.—Pelts of Fur Bearing Animals Produced and Percentage Sold from Fur Farms, Years Ended June 30, 1961-70**

Year Ended June 30—	Pelts <sup>1</sup>		Percentage of Value Sold from Fur Farms	Year Ended June 30—	Pelts <sup>1</sup>		Percentage of Value Sold from Fur Farms
	Number	Value			Number	Value	
		\$				\$	
1961.....	6,237,360	28,737,087	59	1966.....	5,507,199	45,622,852	63
1962.....	5,771,129	28,971,077	64	1967.....	5,274,305	35,496,541	64

1964.....	4,572,594	35,412,822	63	1969.....	5,537,466	40,960,308	56
1965.....	5,609,025	36,534,609	58	1970.....	5,160,983	34,766,389	54

<sup>1</sup> Seal pelts included from 1965.

Table 2 shows the provincial distribution of fur production. Ontario continues to lead the provinces and territories in this respect, accounting for 27.6 p.c. of the total value in the 1969-70 season compared with 30.8 p.c. in the previous season. Although increased percentages were shown by Newfoundland, New Brunswick, Saskatchewan, Alberta, British Columbia and the Northwest Territories, these were offset by decreases in the other provinces.

**Wild Fur Production.**—The principal kinds of wild fur pelts taken, according to value, are beaver, seal, muskrat and mink. These four kinds accounted for 75 p.c. of the total value of wild pelts produced in 1969-70, beaver alone accounting for 41 p.c. The number of beaver pelts produced was somewhat lower than in the previous year and the average value per pelt decreased from \$18.40 to \$15.09. In fact, the average value of every kind of pelt except bear (white and grizzly), fisher, otter, seal and rabbit, was lower in 1969-70 than in 1968-69.

\* Prepared by the Agriculture Division, Statistics Canada.

<sup>1</sup> Commonly known as Alaska fur seal; value figures are the net returns to the Federal Government for pelts sold.

**Fur Farm Production.**—Mink accounts for almost the entire value of fur farm production. In 1970, the number of mink pelts taken was 1,494,000 with a value of \$14,420,000. Mink farms decreased in number from 1,017 to 836 and the number of animals on farms at year-end was 455,300 compared with 572,743 a year earlier. Because of the small numbers involved, coverage of nutria and chinchilla has been discontinued.

**Exports and Imports.**—Canadian fur exports consist largely of those kinds produced in greatest abundance, mink being by far the most valuable followed by beaver, seal, fox, and muskrat. Mink, Persian lamb, dressed seal, dressed sheep and lamb, fox and raccoon make up a large part of the imports. Exports and imports of furs, undressed, dressed and manufactured, to and from Britain, the United States and all countries, are given for the years 1969 and 1970 in Table 6.

### Subsection 2.—The Fur Processing Industry

The general term "fur processing" includes the fur dressing and dyeing industry and the fur goods industry. The former is concerned with the dressing or dyeing of pelts on a custom basis and the latter is a manufacturing industry that makes up fur goods such as coats, scarves and gloves. Tables 7 and 8 give selected statistics for these industries on the "total activity" basis (see Chapter XV on Manufactures) for 1965-69.

### Section 3.—Provincial and Territorial Fur Resource Management

Most of the fur resources of the provinces and territories of Canada are under the administration of their respective governments. Exceptions include those resources within the boundaries of the national parks and the Indian reserves, which are under the administration of the Federal Government. Descriptions of provincial and territorial wildlife conservation measures, which include fur resource management practices, are given in Part IV of this Chapter.

## PART IV.—WILDLIFE RESOURCES AND CONSERVATION\*

Wildlife is an important renewable natural resource. The original inhabitants of what is now Canada depended on it for food and clothing and still do in some remote areas. The coming of the Europeans brought development of the fur trade which guided the course taken in exploring and settling the land as we know it today. When the country was being opened up, a number of mammals and birds became seriously depleted or extinct. As settling progressed, wildlife habitat was reduced by cutting and burning of forests, pollution of streams, industrial and urban development, drainage of wetlands, building of dams, and other changes in the land.

Today, the arctic and alpine tundra, a major vegetational region, has begun to show serious man-made changes. The adjacent sub-arctic and sub-alpine non-commercial forests have been affected principally by increased human travel which causes more forest fires, although the great forests farther south retain much of their original character, despite exploitation. Cultivable lands, originally forest or grass land, have completely changed but they have, in some cases, become more suitable than the original wilderness for some forms of wildlife. The harvestable surplus of game and fur species across Canada is seldom fully utilized and wildlife will remain generally abundant where habitat is preserved and management enlightened.

Today, Canada is known for its varied and abundant wildlife. It maintains most, or all, of the world's stock of woodland caribou, mountain sheep, wolves, grizzly bears and wolverines. These animals exist because of the vast habitat and because of the efforts that have been made to preserve them.

In 1885, the Rocky Mountain Park (now Banff National Park) was established in Alberta, preserving an area of over 2,500 sq. miles in its natural state; in 1887, the Continent's first bird sanctuary was established at Last Mountain Lake in Saskatchewan; in 1893 when wood bison faced extinction, laws were passed to protect them; and in 1907, a nucleus herd of plains bison was established at Wainwright in Alberta. These were among the early attempts at wildlife conservation in Canada.

For a long time, certain species were protected from man and predator. Now, having a better understanding of how nature works, it is recognized that many factors combined cause fluctuations in wildlife numbers, and hunting seasons and bag limits are based to a greater extent on environment. Given a fully stocked environment, the annual increase need only replace the losses. Surplus production can therefore be safely taken by predatory animals or, in case of game species, by man.

As a natural resource, wildlife within each province comes under the jurisdiction of the provincial government. However, the Federal Government does have responsibility for wildlife on federal land, for research and management of species that have a wide range, and for species that are covered by international treaty, such as the Migratory Birds Treaty between Canada and the United States.

### The Canadian Wildlife Service

The Canadian Wildlife Service (CWS) began as an agency to administer the Migratory Birds Convention Act passed in 1917. It was organized in 1947 to meet the need for scientific research in wildlife management and is now a branch of the Department of the Environment.

The CWS conducts scientific research into wildlife problems in the Northwest Territories, the Yukon Territory and the national parks. It advises agencies concerned with wildlife management and co-operates in carrying out recommendations; it advises on and co-ordinates administration of the Game Export Act in the provinces; it co-operates with agencies in Canada and abroad in dealing with national and international problems related to wildlife resources. As administrator of the Migratory Birds Convention Act, the CWS

\* Prepared by the Policy, Planning and Research Service, Department of the Environment, from data received from the provincial authorities concerned.

is responsible for recommending the annual revision of the Migratory Birds Regulations which govern open seasons, bag limits and hunting practices. This it does in consultation with provincial wildlife agencies. Enforcement of the Act and Regulations is carried out by the Royal Canadian Mounted Police, with CWS and provincial co-operation.

The loss of wetlands to drainage and filling for agricultural and other purposes poses a serious threat to waterfowl and, to counteract this, the CWS co-operated with provincial agencies in a major program, started in 1967, to preserve wetlands by purchase and long-term lease. By 1971, 45,000 acres had been bought for \$4,000,000 and 69,000 acres had been re-leased for \$318,000. In addition, the CWS operated 96 bird sanctuaries having a total area of 46,000 sq. miles.

The CWS conducts two annual surveys of waterfowl hunters selected from the 400,000 holders of the Canada migratory game-hunting permits. These surveys provide the CWS with estimates of the species and age of the major game species taken by hunters. Other continuing projects related to migratory game birds include an annual survey of crop damage in the Prairie Provinces, annual surveys of waterfowl populations and habitat conditions in Western Canada, a program to reduce bird hazards at airports, and a search for a substitute for lead shot which each year causes lead poisoning and subsequent death of a large number of waterfowl. Bird-banding provides valuable information on the migration and the biology of birds, and is especially useful in waterfowl management. The CWS headquarters in Ottawa keeps sets of continental banding records and controls the activities of banders operating in Canada. Much attention has been given to species greatly reduced in number or in danger of extinction. By 1971, 21 eggs had been taken from whooping crane breeding grounds and delivered for incubation to the Patuxent Wildlife Research Center in Maryland. Eventually, the progeny from these 21 chicks will be released into the wild but only after a sufficiently large supply of breeding birds has been developed.

Four studies of the population of barren-ground caribou were conducted from 1966 to 1968 in the Keewatin District of the Northwest Territories and in northern Manitoba. The first report is scheduled for publication by the CWS in 1972. The latest estimate of the four major populations of barren-ground caribou in the Northwest Territories was 400,000.

Ecological studies, particularly in areas where development might disturb wildlife habitat, are under way on all types of mammals and include habitat mapping in the Northwest Territories, in the Peace-Athabasca delta of Wood Buffalo National Park, and in several river basins. Toxic chemicals, such as pesticides and industrial compounds, released into the environment in ever-increasing quantities, may produce immediate or long-term effects on wildlife populations. Toxic chemical research aims at finding and measuring these effects so that hazards of such compounds may be more clearly understood. Populations of fish, amphibians, small mammals and their mammalian predators as well as of song, raptorial and aquatic birds are under study.

In 1970, the CWS opened the Wye Marsh Wildlife Centre at Midland, Ont., which was set up to inform Canadians about the forces that shape the land with special emphasis on wildlife, and about man and his environment and how one affects the other. The surrounding 2,500 acres of marsh, forest and overfields are owned and managed by the Ontario Department of Lands and Forests. The Centre is the first of 10 to be situated in such ecologically distinctive areas as the prairies, the northern woods, the Atlantic shores and the desert-like valleys of the western mountains.

The CWS has been participating in the Canada Land Inventory which is a federal-provincial program to gather information on how land in the settled parts of Canada (1,250,000 sq. miles) is being used, and how best it could be used for agriculture, forestry, recreation and wildlife.

Research in limnology includes inventory and productivity of lakes and rivers in the national parks and the biology of fish in associated flora and fauna. Adequate stocks of fish are maintained through modern methods of management, where they can be applied without detriment to the values of the areas concerned.

### Provincial Wildlife Conservation and Management\*

**Newfoundland.**—The functions of the Newfoundland Wildlife Service are: to maintain all indigenous species from extinction and to provide other species where suitable unused habitat exists, always bearing in mind the real and aesthetic values of wildlife that are important to man; to maintain all species in the greatest number possible, consistent with the habitat needs of the species, without serious conflict with the other resource needs; and to provide and regulate the harvest surplus of wildlife populations for the use of the people.

The Wildlife Service manages big game almost solely through the manipulation of hunting regulations based on population data gathered from field studies and hunter questionnaires as well as the transplant of caribou and moose to unoccupied range and the predator controls of lynx around caribou calving grounds. This program has been responsible for a fairly healthy population of animals. Black bear, the only other big game species, have increased in numbers over the past five years and a trapping program is currently in progress to gain information on their distribution and movements. Research is being conducted on the ecology and biology of small game species to prepare for the time when the harvest must be increased to satisfy hunter demand. Habitat management for ptarmigan is under consideration; waterfowl management is conducted by federal authorities.

The wild fur industry in Newfoundland, as elsewhere, has been characterized by short-term instability and a long-term decline period. In general, the price of furs has declined in the past decade and, since the supply of trappers is partially determined by the profit motive, the number of trappers has also declined. As a result, the fur bearers of the province are now considered to be under-harvested. Research and management of the Newfoundland wild fur industry is at present in progress in an effort to exploit this resource more fully. There is no quota for fur bearers other than the beaver for which the quota is 20 beaver per trapper. Studies were started during 1971 on two endangered species—the pine marten and the arctic hare. These studies will provide the basis for a management program to ensure their continued survival.

**Prince Edward Island.**—Wildlife conservation and management programs in Prince Edward Island, mainly concerned with game birds, are conducted by the Fish and Wildlife Division of the provincial Department of Tourist Development. Seasons and bag limits on game species are scientifically adjusted and efforts are being intensified to enforce the regulations established in order to protect species from over-exploitation. The Division operates a reserve offering pheasant and controlled goose shooting, which serves to reduce pressure on other game species. The province is in the process of establishing several waterfowl sanctuaries which will supplement the protection provided by the two federal sanctuaries in the province and is also attempting to improve the habitat for wildlife production by cutting practices, evaluation of hedgerow plants, etc.

**Nova Scotia.**—The Wildlife Division of the Department of Lands and Forests conducts research and management programs, the results of which will help to ensure that the wildlife resource will continue to contribute to the mental, physical and economic well-being of the people of Nova Scotia.

Big game species in the province are undergoing studies by which data are compiled annually on the harvest patterns, age and sex ratios, reproduction, behaviours, etc. Wild fur bearers include beaver, muskrat, mink, otter, wildcat, lynx, fox, raccoon and weasel and these provide a supplementary income for some 3,500 persons who harvest from \$100,000 to \$200,000 worth of wild furs annually. At present, most attention is directed toward the beaver which is the most valuable fur bearer taken. The Trappers Association of Nova Scotia is organized so that persons closest to the resource may have some say in its

\* Prepared by the Department of the Environment from data supplied by the provincial authorities concerned.

wise use and management. One of the aims of the Association is to promote improved marketing and handling of the raw furs taken by trappers so as to upgrade over-all fur quality and thus command more profitable market prices for trappers.

Migratory bird management is shared jointly by the Canadian Wildlife Service and the provincial Wildlife Division. Established programs relevant to population inventories, banding, harvest levels, etc., are conducted on an annual basis by the Division. All major waterfowl areas in the province have been carefully evaluated, including the offshore islands which possess unique ecological features, with the objective of retaining them for the benefit of future generations, and several large waterfowl areas are now owned by the province. The role played by Ducks Unlimited (Canada) has been extremely valuable in establishing a successful program of waterfowl habitat improvement in Nova Scotia. Various techniques are employed annually to determine population levels and other factors of upland game species that are essential when formulating proposals aimed at the wise use and management of the resource.

There are 19 federal and provincial areas in Nova Scotia totalling about 500,000 acres of land and water where wildlife is protected. Among them is the Provincial Wildlife Park at Shubenacadie, where a program of studies relating to parasites and disease and the rearing of wildlife for release is a feature additional to its function as a recreational and educational park. Mention should also be made of the very important role of Acadia University in the provincial wildlife program. Various research programs conducted by that institution and the free exchange of ideas between the two agencies have greatly enhanced the resource management efforts in Nova Scotia.

**New Brunswick.**—The management of wildlife in New Brunswick is under the jurisdiction of its Department of Natural Resources. In recent years, deer management zones have been established in an attempt to control the distribution of hunting pressure on this animal. Biological studies of the white-tailed deer are being conducted, including the ecology of winter and spring habitat, aerial census of winter populations and an annual population analysis based on deer registration data. Also, a moose management program is under way which includes many restrictions and regulations in the administration of this limited wildlife resource. Biological studies indicate that its population has improved significantly in numbers and condition under the controlled hunting program.

Beaver, muskrat and bobcat are the three most important fur bearing animals in the province. During the early 1900s, beaver became scarce but, as a result of protection, they increased rapidly in numbers so that now there is no limit imposed on the trapping of these animals. Each autumn, an aerial survey of active colonies of beaver is conducted over about 4,000 stream-miles to keep a continuing record of their prevalence.

There is, at the present time, no limit on the trapping of any wild fur bearer in the province. The trapping of fisher and marten was permitted during the 1964-65 season for the first time since 1946. These animals, found mainly in the northern part of the province, appear to be increasing in number and extending their range southward. Currently, investigations are continuing into the ecology of fisher and marten as well as of beaver and muskrat.

During 1971, a new system of estimating hunting effort and harvest information for game birds was undertaken and found to provide more reliable data than were previously available. Closed seasons for certain species are invoked, sometimes on short notice, when considered necessary for preservation reasons. Management practices in New Brunswick for migratory birds have been limited for the most part to co-operative programs with other agencies, particularly the Canadian Wildlife Service. Examples of the projects under way are the woodcock singing ground census and the co-operative waterfowl banding program. In 1970, a grouse management plan was organized, and methods and mechanical procedures for selected projects were evaluated.

**Quebec.**—The management and protection of wildlife within Quebec is a function of the Fish and Game Branch of the Department of Tourism, Fish and Game. The Branch

has two Services, one dealing with wildlife management and the other with conservation. The Wildlife Service is responsible for management, particularly of those species of interest to hunters and fishermen. The work of staff biologists, who are assigned to geographical units known as management districts, includes the collection of precise data on animal populations and habitats in the respective areas. In connection with the management of the fisheries resources, wildlife managers have recourse to the services and resources of the Fisheries Stations Division and the Technology and Engineering Services Division; the former operates four provincial hatcheries, inspects commercial hatcheries, and controls the importation of fish eggs and species of salmon brought in for propagation. The Wildlife Service also administers and maintains the Quebec Zoological Gardens. The Conservation Service works closely with the Wildlife and Parks Services and is responsible for enforcing fishing and hunting regulations and for informing the public of the existence of such regulations and of their scope and importance. The Wildlife Conservation Act, which came into force in December 1969, is intended to protect fish and wild animal species within the province.

**Ontario.**—The objective of recreational wildlife management programs in Ontario is the provision of high-quality wildlife hunting and viewing opportunities for as many residents as possible.

The most important factor limiting deer numbers in Ontario appears to be the decreasing extent of deer range. An important aspect of the management program is the improvement and increase of existing winter range. Moose management is concentrated on intensive production and harvest inventory and evaluation of the effect of various forest practices on moose range. Ultimately, moose range and forest management will be integrated in such a way as to optimize both fibre and moose production.

Upland game management is directed toward realization of maximum recreational opportunities on a day-use basis for hunters as well as for naturalists interested in small game and non-game species. Management practices include increasing the production of small game through habitat management and provision of accurate predictions of the annual availability of small game. Waterfowl banding is important in developing a reasonable management program for an international resource. Re-establishment of a breeding population of the giant Canada goose in southern Ontario is a specialized part of the Ontario migratory bird program.

*A Conservation Officer in northern Ontario tagging a mallard duck, one of about 15,000 waterfowl tagged each year in the province. This is but one of the many varied tasks he performs in his capacity as a protector, conservator and manager of the wildlife in his area.*

The wildlife management areas that have been established provide opportunities for nature study and hunting in southern Ontario, where virtually all lands are privately owned. Their existence also ensures preservation of valuable wetlands.

Much of the effort in Ontario in managing wild fur bearers is directed to beaver which at the present time are very abundant throughout the province. On Crown lands, there are some 2,300 registered traplines for which beaver harvest quotas are set annually. These quotas serve an important role in maintaining a sustained yield of this valuable species. Other important species sought by the trappers are also those that live in or around water—muskrat, otter and mink. Collectively, these four species make up about 90 p.c. of the total value of the fur harvest in the province which varies from \$3,500,000 to \$5,500,000.

The Department of Lands and Forests, responsible for the management of wildlife in Ontario, conducts trappers' meetings regularly throughout the province where new traps and trapping techniques are discussed. Some of the trappers belong to trappers' councils and a large proportion of them are members of the Ontario Trappers' Association, which operates an auction house at North Bay.

**Manitoba.**—The Manitoba Department of Mines, Resources and Environmental Management has the primary responsibility for the conservation of wildlife stocks in the province. Authority to do so is provided by provincial legislation (the Wildlife Act and the Predator Control Act), although the federal Migratory Birds Convention Act is the authoritative legislation in the conservation of waterfowl and other migratory species. The Wildlife Act provides legal protection for all animals and birds that are part-time or full-time winter residents of the province. The Migratory Birds Convention Act protects migratory game birds, migratory insectivorous birds and migratory non-game birds. The Predator Control Act is the legal basis for authorizing control measures on predatory animals.

The Department of Mines, Resources and Environmental Management has four Divisions; each has some responsibility for wildlife conservation and each is multi-disciplinary in nature, having a staff responsible for one of the important natural resources. The Research Branch of the Division has a staff of biologists working on problems in the fur bearer, the game bird and the big game areas of the wildlife field.

The Resources Management Division is subdivided into four administrative regions which cover the whole province, and a co-ordinating head office. The director in charge of each region is responsible for the field administration of the entire wildlife program in his area and for the enforcement of the wildlife laws and regulations. Each region is involved to some extent in habitat preservation. Eight wildlife management areas established on Crown land distributed across southern, western and northern Manitoba are designated for primary use by wildlife, although other compatible land-use activities are also permitted. In addition, there is a major concentration of wildlife management areas in the Interlake District, established under the ARDA and FRED federal-provincial cost-sharing programs. These programs provide funds for detailed land-use studies and for major land adjustments resulting from these studies. Regulations covering wildlife harvesting are established each year by discussion.

**Saskatchewan.**—Before 1945, little was done to control the trapping of beaver and muskrat in Saskatchewan, other than to establish close season when the fur bearers became depleted from over-trapping, and the lack of conservation and management policy had a disastrous effect upon the fur resources and the livelihood of trappers. In 1946, under federal-provincial agreement, all Crown lands north of the 53rd parallel were set up as the Northern Fur Conservation Block. Up to \$50,000 a year was to be expended over the following 10 years to establish and administer conservation areas, purchase equipment, pay salaries of personnel, transplant live beaver and build dams; the Federal Government agreed to assume 60 p.c. of the cost and the province the remainder. A Fur Advisory Committee, with representation from the provincial Department of Natural Resources and the (then) federal Indian Affairs Branch was set up to supervise the program. Organ-

ization of conservation areas was left to the trappers. Five-man councils were elected in all districts, with Indian, metis and white trappers sharing privileges, obligations and responsibilities on an equal basis. Conservation measures and licensing regulations were initiated. Since 1946, the agreement has been extended several times until 1972 and the sharable amount raised to \$120,000. This Northern Fur Conservation program has served to encourage the people involved to plan and carry out other programs vital to their well-being, but it is expected that it will soon be replaced by a new agreement. Both governments feel that the scope of such an agreement should cover a wider range of renewable resources, such as fisheries, forestry and outdoor recreation, in addition to the wildlife resource.

**Alberta.**—The conservation and management of wildlife resources in Alberta are under the jurisdiction of the Fish and Wildlife Division of the Department of Lands and Forests, which has been undergoing reorganization over the past two years. Meetings are held with registered trappers to increase the exchange of information between them and the Division's officers and an intensive program is being initiated to eliminate, as far as possible, the misuse of trapping areas and to form them into more economical units.

The major shift in wildlife operations in the past two years has been toward a number of key projects, most of which are of two-year or three-year duration. These include studies on the effects of industrial development on wildlife, experimental techniques to lure waterfowl off problem areas into a variety of "baited" field and feeding stations, domestic cattle-wildlife ranges, range conditions, experimental shelterbelt planting for upland game birds, waterfowl programs such as banding and transplanting, and animal movement and population trends. Collection of upland game birds for pesticide residue analysis continued in 1971. Field surveys and mapping under the Canada Land Inventory program continued during the year.

**British Columbia.**—The wildlife resources of British Columbia are administered under authority of the Wildlife Act, 1966 by the Fish and Wildlife Branch of the Department of Recreation and Conservation. Most of the over-all planning and co-ordination of wildlife management activities in the province takes place in the headquarters of the Wildlife Management Division but the actual management is carried out in seven regions, in each of which the resident biologist has responsibility for the planning, supervision and overseeing of the wildlife management projects in his own region.

Wildlife management includes the assessment and protection of wildlife populations and their habitat, the regulation and statistical documentation of public use of the wildlife resource, the collating and distribution of information pertaining to wildlife, both regionally and provincially, the regulation and control of wildlife imports and exports, and active participation with and advice to related government agencies indirectly involved with the wildlife resource.

The wild fur resource is managed under a registered trapline system in effect since 1926. Registered traplines are areas of Crown land allotted, for the purpose of trapping wild fur, to trappers who are resident in the province. Registration of a trapline is renewable on an annual basis by the trapper, subject to certain requirements of 10 years aimed at conservation in sustained yield of the fur species.

### Section 1.—Electric Power Development

#### Subsection 1.—Historical and Current Trends in Power Development

Electric power development in Canada has undergone remarkable and sustained growth since the beginning of the century. From a modest 133,000 kilowatts of generating capacity installed at the end of 1900, Canada's installed hydro capacity rose to 28,304,000 kw. by the end of 1970 and thermal capacity to 14,325,000 kw.

Thermal-electric power development in Canada was not well documented early in the century but it is apparent that its growth was slow and of relatively minor importance until the late 1940s. The rate of development of hydro facilities, on the other hand, tended to accelerate after the turn of the century when improvements in electric power transmission techniques were introduced and increasing emphasis began to be placed on the construction of large hydro-electric stations.

During the prosperous 1920s, demand for electricity became heavier and the rate of installation increased appreciably. Then, under the depressed conditions of the early 1930s, power demand dropped off but did not show up immediately as a drop in the installation rate because of the time lag inherent in hydro-electric power development. The completion of hydro projects initiated prior to the depression period accounted for the continuation of a high rate of capacity installation up until 1935; thereafter, poor economic conditions in the 1935-39 period resulted in a reduced rate.

In the early war years, the tremendous demand for power to drive Canada's war industries accounted for the sharp rise in installation of new generating facilities between 1940 and 1943, but in the later war years construction dropped off so that, from 1944 to 1947, a second flattening occurred in the growth curve. After the War, industrial expansion and rapidly growing residential and agricultural development placed extremely heavy demands on power generating facilities. To stay abreast of these demands required

\* Sections 1 and 2 of this Chapter were prepared by the Energy Development Sector of the Department of Energy, Mines and Resources, Ottawa; Sections 3 and 4 were revised by the Energy and Minerals Section of the Manufacturing and Primary Industries Division, Statistics Canada, and Section 5 by the various provincial Commissions concerned.

the installation of new capacity at a rate higher than at any time in Canada's history. These demands also led to the start of an extensive program of thermal plant construction in the early 1950s, since they could not be satisfied from hydro sources alone. In 1956, thermal generation represented 14 p.c. of installed capacity. Since then, the annual installed capacity has averaged 56 p.c. hydro-electric and the remainder in thermal generation with the result that at the beginning of 1971 thermal generation accounted for 34 p.c. of Canada's installed capacity.

Table 1 shows the status of installed generating capacity in hydro and thermal stations and the combined total for all stations as at Jan. 1, 1971.

**1.—Installed Hydro- and Thermal-Electric Generating Capacity,  
by Province, as at Jan. 1, 1971**

Province or Territory	Hydro	Thermal	Total
	kw.	kw.	kw.

Percentage increase during 1970 .....	4.7	14.5	7.8

**Current Trends.**—Although water power traditionally has been and still is the main source of electric energy in Canada, thermal sources some day will undoubtedly become the main supplier. The choice between development of a hydro-electric power site and construction of a thermal generating station must take into account a number of complex considerations, the most important of which are economic in nature. In the case of a hydro-electric project, the heavy capital costs involved in construction are offset by maintenance and operating costs considerably lower than those for a thermal plant. The long life of a hydro plant and the dependability and flexibility of operation in meeting varying loads are added advantages. Also important is the fact that water is a renewable resource. The thermal station, on the other hand, can be located close to the demand area, with a consequent saving in transmission costs. With the current trend to large steam stations, however, a certain amount of the flexibility of location of thermal stations is lost because such units require considerable quantities of water for cooling purposes, making it essential that they be sited close to an adequate water supply.

The marked trend to thermal development which became apparent in the 1950s can be explained in part by the fact that, by that time in many parts of Canada, most of the hydro-electric sites within economic transmission distance of load centres had been developed and planners had to turn to other sources of electric energy. More recently, however, advances in extra-high-voltage transmission techniques are providing a renewed impetus to the development of hydro power sites previously considered too remote.

Thermal power generation may use fossil fuels or nuclear fuels as the sources of energy. The fossil fuels—coal, gas or oil—can be obtained economically from domestic sources in some parts of Canada. In other regions the cost of transportation leads to the use of im-

*Pickering nuclear power station became part of the regular Ontario Hydro grid in the summer of 1971 when reactor one was declared in-service a month ahead of schedule. When all four reactors are operating in 1973, the station will produce more than 2,000,000 kw. of electricity. The natural uranium, heavy-water reactor design is uniquely Canadian.*

ported fossil fuels. Nuclear fuels are providing an increasingly important source of energy for thermal power plants and will be especially attractive for those regions where fossil fuel costs are relatively high and where the power system permits the use of very large generating units which show the best economic advantage for nuclear plants. The CANDU reactor system, which is providing the heat source for Canadian nuclear plants, allows the use of natural uranium mined and processed in Canada.

Because of the relatively long starting-up time required by large thermal units, thermal stations tend to lack flexibility of operation and can be used most efficiently to meet continuous load conditions. Hydro stations, on the other hand, can put generating units on line with minimum delay and hence are admirably suited to supply power to meet the peak loads which may occur several times each day. This applies mainly to hydro plants located close to load centres where peaking operation does not require substantial extra transmission cost. By combining the advantages of both hydro and thermal stations in integrated supply systems, power producers are now achieving much greater flexibility of operation.

Another trend in development designed to meet the problem of varying daily loads is the use of pumped storage. An example is the Sir Adam Beck hydro development at Niagara Falls where water taken from the Niagara River above the Falls is carried by tunnel and power canal to penstocks which supply the main generating station on the bank of the Niagara River some distance below the Falls. In off-peak hours, power from the main station is used to pump water from the power canal into a reservoir maintained at a higher level; during peak-load hours, the pumps, which are dual-purpose units, operate

as generators and are driven by water released from the reservoir. The pumping-generating units at this development make available an extra 176,700 kw. of generating capacity. A pumping-generating station using the same general principle has been constructed on the Brazeau River in Alberta as part of the 305,500-kw. Big Bend hydro development.

Perhaps the most promising application of the pumping-generating principle is its use in conjunction with nuclear power stations. Nuclear units, in common with the larger conventional thermal units, can be used most efficiently under conditions of continuous operation. Off-peak nuclear power can be used to operate pump-turbine units and the hydro-electric power derived from operating the units as generators is available for use during periods of peak demand.

### Subsection 2.—Utilization of Electric Energy

In 1970, Canada's generating facilities produced 203,714,000,000 kilowatt hours of electric energy, after allowing for the energy used in the power stations themselves. Of this total, 76.7 p.c. was produced in hydro-electric stations and the remainder in thermal stations. Electric energy exported to the United States exceeded imports by 2,403,000,000 kwh. during 1970, so that the total energy available in Canada amounted to 201,311,000,000 kwh.

Industry uses approximately 58 p.c. of the total electric energy made available in Canada; residential and farm use accounts for 20 p.c. and commercial use for 13 p.c. The remaining 9 p.c. is listed under "losses and unaccounted for". Because many power producers do not distinguish in their records between residential and farm customers, the amount of energy used is combined. Energy used for street lighting represents less than 1 p.c. of total energy made available and is included in the "commercial category".

About 22 p.c. of the total energy made available is used in the mineral industry with approximately three quarters of this amount being consumed by the smelting and refining processes. The pulp and paper industry accounts for 15 p.c. and all other industries combined for an additional 21 p.c. Of the latter, the chemical industry and the primary iron and steel industry consume almost one half.

The availability of large water-power resources in those regions in which the more important mineral deposits have been found has greatly facilitated mining development. Recent examples are the nickel mining and refining complex at Thompson, Man., which uses hydro-electric power generated in the Kelsey plant on the Nelson River, and the iron ore mining operations in Labrador, supplied by the Twin Falls plant on the Unknown River. Metal mining, a very important division of the Canadian mining industry, is carried on mainly in two physiographic regions—the Western Cordillera and the Canadian Shield. In the Western Cordillera, the mountainous topography and the relatively high amounts of precipitation favour the development of water power. In the Canadian Shield, which is a Precambrian formation stretching in a wide sweep around Hudson Bay from the Mackenzie River basin to the eastern tip of Labrador, heavy glaciation in recent geological times has formed river systems which are comparatively young and are characterized by large numbers of lakes connected by short river sections, with numerous rapids and falls suitable for the development of hydro-electric power.

Canada has no known deposits of bauxite but the availability of low-cost hydro-electric power has fostered the establishment of a large aluminum industry that produces one eighth of the world's supply of this metal, most of which is exported from Canada. Further evidence of the value of water power to mining operations is provided by the fact that Canada's asbestos industry, which produces about 35 p.c. of the world's supply of asbestos fibre, obtains the major part of its power supply from hydro-electric sources.

Canada's pulp and paper industry is one of the world's great industrial enterprises. Total mill capacity for the production of newsprint paper is considerably greater than that of any other country in the world, and in total production of wood pulp Canada is second only to the United States. The fact that about 90 p.c. of the manufactured newsprint is

exported gives some indication of the importance of the industry to the Canadian economy. By far the larger portion of the energy used in the pulp and paper industry is derived from water power.

The traditional reliance on hydro-electric generation by the mining and pulp and paper industries is more an indication of the abundance of hydro sites within economically accessible distances of demand areas rather than a definite preference for hydro as opposed to thermal generation. As the number of available hydro sites continues to decline, both industries are beginning to realize that their energy requirements can be met equally as well by thermal generation.

### Subsection 3.—Hydro-Electric Generation

As discussed in Subsection 1, hydro-electric generation will play an increasingly lesser, yet significant role in Canada's future electrical development. By the beginning of 1971, the hydro portion of the country's total generating capacity had fallen to 66 p.c. from over 90 p.c. twenty years earlier.

In view of the vast water resources existing throughout Canada, there would appear to be a myriad of undeveloped sites that could conceivably be potential sources of hydro-electric power. It is not sufficient, however, to assume that all of these possibilities represent economically viable sources of electric power. In fact, only a very minor portion of the sites with a theoretical power potential can actually be developed competitively. Before a site can be termed a veritable source of potential power, a detailed analysis of such factors as costs, geography, geology and ecology must be performed. And until a study is completed on a national scale, estimates of Canada's undeveloped water power resources may tend to be misleading; a recent estimate places them in excess of 60,000,000 kw.

Figures of water-power resources already developed are given in Table 1 and are based on the manufacturer's rate in kilowatts as shown on the generator name-plate, or derived from the rating where it is indicated in kilovolt-amperes. The maximum economic installation at a power site can be determined only by careful consideration of all the conditions and circumstances pertinent to its individual development. It is usual practice to install units having a combined capacity in excess of the available continuous power at Q50 (flow available 50 p.c. of the time), and frequently in excess of the power available at Qm (arithmetic mean flow). There are a number of reasons for this. The excess capacity may be installed for use at peak-load periods, to take advantage of periods of high flow, or to facilitate plant or system maintenance. In some instances, storage dams have been built subsequent to initial development to smooth out fluctuations in river flows. In other cases, deficiencies in power output during periods of low flow have been offset by auxiliary power supplied from thermal plants, or by interconnection with other plants which operate under different load conditions or are located on rivers with different flow characteristics.

Thus, the extent to which the installed capacity exceeds the available continuous power at the various rates of flow is dependent upon the factors that govern the system of plant operation, and varies widely in different areas of the country.

**Provincial and Territorial Distribution.**—The provincial and territorial distribution of installed hydro-electric generating capacity, given in Table 1, reveals that substantial amounts of water power have been developed in all provinces except Prince Edward Island, where water-power resources are meagre. As natural-resource development proceeds, the fortunate incidence of water power in proximity to mineral, forest and other resources becomes increasingly apparent. The existence of large amounts of potential hydro power on northern rivers may well prove to be a factor of prime importance in the eventual realization of the natural wealth of the Canadian North.

The water-power resources of *Newfoundland* are considered to be of very substantial magnitude. On the Island, although the length of the rivers is generally not great, topography and run-off are favourable for hydro-electric power development. Of the substantial

capacity installed, a very large portion serves the pulp and paper industry. In Labrador, the Churchill River and its tributaries, now under development, constitute one of the largest potential sources of water power in Canada.

In *Prince Edward Island* there are no large streams and water-power plants are limited in size to those used to operate small mills. The water-power resources of *Nova Scotia* and *New Brunswick*, although small in comparison with those of other provinces, are a valuable source of energy and make a substantial contribution to the economies of the two provinces. Numerous rivers in both provinces provide moderate-size power sites either within economic transmission distance of the principal cities and towns or advantageously situated for use in development of the timber and mineral resources. These provinces have, however, turned to coal-fired thermal generation and are increasingly utilizing oil.

*Quebec* is the richest of all the provinces in water-power resources, possessing about 40 p.c. of the total for Canada. Quebec also leads in developed water power, its installation of 13,279,000 kw. in 1970 representing about 47 p.c. of the national total. Notable developments are the Quebec Hydro-Electric Commission's 1,574,260-kw. Beauharnois development on the St. Lawrence River, the Commission's 1,015,200-kw. Manic 2 development on the Manicouagan River, its Bersimis I development on the Bersimis River having an installed capacity of 912,000 kw., and its 1,292,000-kw. Manic 5 development, of which five units (807,500 kw.) were in service by the beginning of 1971. The Aluminum Company of Canada Limited owns the 742,500-kw. Chute des Passes plant on the Péribonca River. The Manic 5 development is part of a major power project which represents a significant advance in the development of Quebec's hydro-electric resources. This project, involving the harnessing of the headwaters of the Manicouagan and Outardes Rivers, will permit the eventual installation of some 5,540,000 kw. on the two rivers; a total installation of 3,749,000 kw. was in service at the beginning of 1971. Power production in the province is facilitated by the regulation of stream-flow by the provincial Department of Natural Resources through the storage dams which it owns and operates. Some of the responsibility for regulation rests with the Quebec Hydro-Electric Commission.

Almost all of the sizable water-power potential in *Ontario* within easy reach of demand centres has been developed and planners are looking to the more remote sites as new sources of supply. Improvements in long-distance transmission techniques may bring some of these sites within the economic range. Most of the hydro-electric power produced in the province comes from the generators of The Hydro-Electric Power Commission of Ontario, Canada's largest power producing and distributing organization. Ontario's largest hydro-electric generating station is located on the Niagara River at Queenston, where the Sir Adam Beck-Niagara Generating Stations Nos. 1 and 2 and the associated pumping-generating station have a combined generating capacity of 1,814,950 kw. In addition to the power generated in its own plants, the Commission purchased electric power generated outside the province to the extent of 3 p.c. of its total requirements in 1970.

Of the three Prairie Provinces, *Manitoba*, with immense hydro-electric capabilities on the Winnipeg, Churchill, Nelson and Saskatchewan Rivers, is the most generously endowed with water power resources. Until recently, hydro-electric generating stations on the Winnipeg River supplied most of the power requirements of southern Manitoba. Manitoba Hydro's high-voltage, long-distance transmission lines, however, will carry ever-increasing amounts of power south from hydro-electric stations on northern rivers to help meet the province's constantly growing power demands. Of particular interest is the initial development of the Nelson River System. The Kettle Rapids site is being developed toward an ultimate capacity of 1,224,000 kw. and power will be transmitted over a 556-mile high-voltage direct current transmission system at  $\pm 450$  kilovolts to a receiving station near Winnipeg. Large water power resources exist in the central and northern parts of *Saskatchewan*, principally on the Churchill, Fond du Lac, and Saskatchewan Rivers. Power from Squaw Rapids on the Saskatchewan River is fed into the transmission network of the provincially owned Saskatchewan Power Corporation, which serves the more settled areas of the province. Before the completion of this development in 1963, these areas had been

served by electric power from thermal plants fuelled by coal, oil or natural gas, the hydro-electric power generated in the province being used almost exclusively for mining purposes in northern areas. In *Alberta*, most of the principal hydro-electric developments are located on the Bow River and its tributaries and, from these developments, Calgary Power Ltd. serves most of the southern part of the province. The Big Bend hydro-electric development on the Brazeau River in the headwaters of the North Saskatchewan River, completed in 1967, augmented the energy from the Bow River plants and another development on that river at Bighorn will add 108,000 kw. in 1972. Substantial water power resources are located in the northern regions and, although these are somewhat remote from present centres of population, the advent of extra-high-voltage transmission has enhanced the prospect of their development.

*British Columbia* has many mountain streams that offer abundant opportunity for the development of hydro-electric power. In terms of installed hydro capacity, the province is exceeded only by Ontario and Quebec. Notable for the magnitude of their power potential are such rivers as the Columbia, the Fraser, the Peace and the Stikine. Until 1968, hydro developments on smaller rivers in the southern areas satisfied the major load requirements of the province but in that year the immense power resources of the Peace River began to supplement the energy supply. Development of the hydro potential of the Canadian portion of the Columbia River is under way, utilizing the water stored behind three huge storage reservoirs, two of which have been completed and the third scheduled for 1972. The foremost producer and distributor of electric power in British Columbia is the provincially owned British Columbia Hydro and Power Authority.

Power from present developments in the *Yukon Territory* and the *Northwest Territories* is used largely to satisfy the needs of local mines and adjacent settlements. The Northern Canada Power Commission is authorized to construct and manage public utility plants in both Territories. A preliminary evaluation of the hydro-electric potential has been made for most of the major rivers in the Yukon Territory and in the central portion of the Mackenzie District of the Northwest Territories. The results of these studies indicate that a very substantial water-power potential exists; the Yukon River and its tributaries alone represent some of the largest undeveloped hydro-electric resources in North America.

#### Subsection 4.—Thermal-Electric Generation

The incidence of immense water-power resources in Canada and the brisk pace of their development has tended to overshadow the very considerable contribution being made by thermal energy in the nation's power economy. At the end of 1970, the total installed thermal capacity in Canada was 14,325,000 kw., representing about 34 p.c. of the total electric generating capacity in the country. The fact that energy produced in thermal plants during the year accounted for only 23 p.c. of the total may be attributed in part to the fact that a considerable amount of the capacity installed is operated for peak-load duty, with hydro-electric capacity providing base-load generation. This pattern will change with the introduction of additional nuclear-fuelled thermal generation plants which can be operated economically at high capacity factors for base-load purposes.

**Conventional Thermal Power.**—Over 90 p.c. of all thermal power generating equipment in Canada is driven by steam turbines. The magnitude of loads being carried by steam plants combined with the economies of scale has led to the installation of steam units with capacities as high as 500,000 kw. where systems are large enough to accommodate them. The remainder of the load is carried by gas turbine and internal combustion equipment. The flexibility of internal combustion engines makes this type of equipment particularly suitable for meeting power loads in smaller centres, especially in the more isolated areas.

Table 1, p. 716, shows that thermal generation is predominant in Prince Edward Island and Nova Scotia. Also, by the end of 1970, the Northwest Territories and Ontario had joined Alberta, Saskatchewan and New Brunswick as provinces and territories having

greater than one half of their total capacity thermal-electric. It is expected that thermal generation will become increasingly predominant in Ontario.

Thermal capacity in Newfoundland had, until recently, consisted of small internal combustion stations serving more isolated communities, together with a few medium-sized gas turbine and steam turbine units in larger centres. However, during 1970, the province's first major thermal station, Holyrood, went into service with the commissioning of the first of two 150,000-kw. steam units. The plant, which was scheduled for completion in 1971, is fuelled by residual oil from a nearby refinery. Although coal is still the most important fossil fuel for thermal plants in Nova Scotia, oil is rapidly becoming the preferred choice for thermal-power generation in all of the Atlantic Provinces.

The abundance of Quebec's water-power wealth, much of it in reasonable proximity to existing demand areas, has limited the application of thermal power to specific local use. And now, with the added impetus of new developments in transmission technology allowing the economic transportation of large blocks of power over long distances, it seems likely that Quebec will continue to concentrate on hydro-electric power and develop some of the more remote regions such as the rivers flowing into James Bay. Nevertheless, Quebec is beginning to look toward thermal power since it will serve not only to help guarantee an adequate power supply in the face of increasingly heavy demands but also to render the almost exclusively hydro-electric base more flexible through integrated operation. Quebec's largest thermal plant, the Tracy station near Sorel, has an installed capacity of 600,000 kw.

Ontario has more thermal capacity than any other province in Canada; capacity installed at the beginning of 1971 was 6,819,000 kw., which represents about 47 p.c. of the national total. Ontario Hydro's Lakeview station at Toronto is Canada's largest thermal generating station having an installed capacity of 2,430,000 kw. The Lambton station near Sarnia reached its designed capacity of 2,000,000 kw. in 1970. Two more conventional thermal stations are planned with final capacities of 4,000,000 kw. (at Nanticoke, near Port Dover) and 2,295,000 kw. (at Lennox, west of Kingston). With the exception of Lennox, which will use oil fuel, Ontario's fossil-fuelled thermal plants are designed to be coal-fired.

Manitoba supplements its predominantly hydro-based power supply with a substantial amount of thermal capacity but current emphasis is on development of water-power resources. Saskatchewan, until recently, relied on thermal capacity to satisfy the needs of the more settled areas and hydro-electric power generated in the province was used almost exclusively for mining purposes in the northern areas. In the past few years, however, development of storage on the Saskatchewan River has made hydro-electric power from Squaw Rapids and Coteau Creek available in the southern part of the province. Thermal generation is providing the next stage of expansion with extensions under way at Boundary Dam (Estevan) and Queen Elizabeth (Saskatoon) stations. The availability of vast fuel resources accounts for the emphasis on thermal power generation in Alberta; the province's largest thermal plants are the 405,000-kw. gas turbine and steam station at Edmonton and the 582,000-kw. Wabamun steam station. Planned thermal expansion includes the 140,000-kw. H.R. Milner station (near Grande Cache), a 300,000-kw. addition to the Sundance station (near Wabamun), and a 165,000-kw. addition at the Clover Bar plant. Similar-sized units were commissioned at Sundance and Clover Bar during 1970.

About two thirds of British Columbia's thermal generating capacity is installed in three plants located in the Vancouver area. The capacity of the largest of these plants, the Burrard generating station, is 750,000 kw. Only minor thermal additions were made in the province during the year and no major additions are contemplated in the near future.

Until 1965, most of the power requirements of the Northwest Territories were satisfied from thermal sources but the commissioning of the Twin Gorges hydro station on the Taltson River in that year altered the balance in favour of hydro. However, new additions in 1970 made thermal facilities once again the dominant source of power. In the Yukon Territory, hydro is the larger contributor. Virtually all of the thermal-electric energy in the Territories has been generated by small diesel units. Present indications are that future growth will continue to concentrate on diesel generation but the magnitude of the units installed will be substantially greater.

**Nuclear Thermal Power.**—Commercial electric power generated from the heat of nuclear reaction became a reality in Canada in 1962 when the 20,000-kilowatt electrical (kwe.) Nuclear Power Demonstration station at Rolphton, Ont., fed power for the first time into a distribution system in Ontario. The NPD station is the forerunner in a series of large nuclear stations that will shoulder more and more of Canada's rapidly growing power loads.

Research into reactor design and the application of nuclear energy in the electric power field are among the more important responsibilities of Atomic Energy of Canada Limited, a Crown company incorporated in 1952 (see also pp. 454-459). AECL has concentrated its efforts on the development of the CANDU reactor, which uses natural uranium as a fuel and heavy water as the moderator. By using heavy water as the moderator, a high energy yield can be obtained from natural uranium and, since natural uranium is a low-cost nuclear fuel, the cost of fuel is a minor component in the cost of producing power. Natural uranium has the added attraction of being available in commercial quantities in Canada.

The NPD station has been used extensively to demonstrate the ability of the system to operate at a high capacity factor and to determine the nature and predictability of outages. Fuel changes while the system is in operation have become routine and a considerable amount of research into the sources of heavy water losses has been carried out. As a result of this research, losses have been cut down and the NPD station is demonstrating that a very acceptable heavy-water loss rate is attainable. The station was modified in 1968 to a boiling heavy-water mode of operation to provide additional demonstration capabilities.

At Douglas Point on the shore of Lake Huron, the country's first full-scale nuclear power station went into commercial production in 1967. The station, built with the co-operation of Ontario Hydro, houses a 200,000-kwe. CANDU reactor. Experience gained in the design and operation of this reactor has encouraged the development of even larger units and construction of the four-unit, 2,160,000-kwe. Pickering nuclear station is well advanced near Toronto, with in-service dates for the units scheduled for 1971 to 1974. Construction of the Bruce nuclear station for Ontario Hydro is under way with four 800,000-kwe. units planned for installation during 1975 to 1978.

A further step in the development of the CANDU reactor is the use of boiling light water instead of pressurized heavy water as the coolant. Quebec's Gentilly nuclear station near Trois-Rivières utilizes boiling light water in its CANDU reactor. This station came into service in 1971 with 250,000 kwe. of nuclear-electric capacity.

### Subsection 5.—Electric Power Transmission

The nature of the loads handled by the small, widely scattered generating systems in the early days of the electric power industry in Canada did not warrant the expense of interconnecting power systems. However, as the demand for dependable electric power increased and improved techniques reduced power transmission costs, the benefits of integrating power systems to achieve reliability of service and flexibility of operation were re-appraised. Today, most of Canada's generating stations are components of large, integrated and often interconnected power systems operated by power utilities and companies in the various provinces.

Constant research in the field of power transmission has developed techniques that enable power producers to utilize hydro-electric sites previously considered beyond economic transmission distances. Most noticeable, perhaps, is the progressive stepping-up of transmission-line voltages. In Canada, there are a number of transmission lines designed for operation at 500,000 volts and 735,000 volts. A 574-mile, 500,000-volt line is in service to carry power from the Peace River to the lower mainland of British Columbia. In Ontario, a 435-mile, 500,000-volt line carries power from hydro-electric plants in the James Bay watershed to Toronto. In 1965, Hydro-Quebec achieved world leadership when power was carried for the first time at 735,000 volts over the 375-mile transmission line between Quebec's Manicouagan-Outardes hydro complex and the cities of Quebec and Montreal.

By the end of 1970, 1,022 miles of the initial program for 1,228 miles of the 735,000-volt line had been completed and work was proceeding on three additional 735,000-volt circuits to transmit energy from the Churchill Falls complex commencing in 1972.

Most power is transmitted with alternating current but three applications of high voltage direct current (HVDC) have been found in Canada. In service in British Columbia is a 260,000-volt HVDC link from the mainland to Vancouver Island. It has a capacity of 312,000 kw. and includes 21 miles of undersea cable; it is a monopolar system using the ground as the return path for current. A second HVDC system is expected to be placed in service in 1972 over two 555-mile lines from the Kettle generation station on the Nelson River to Winnipeg. The initial capacity is 810,000 kw. and the planned ultimate rating is 3,200,000 kw. Another application is designed to provide a non-synchronous tie between the systems of New Brunswick and Quebec; this is a 320,000-kw. back-to-back HVDC system located at Eel River, N.B., which will be placed in service in 1972 and will employ solid state thyristor valves in place of the mercury arc valves used for the earlier HVDC systems.

Interconnections of from 66,000 to 230,000 volts exist between British Columbia and Alberta; Saskatchewan, Manitoba, Ontario and portions of the Quebec system are interconnected and, through the Ontario Hydro system, are linked with the northeastern United States systems; and Quebec, New Brunswick and Nova Scotia systems are interconnected. The first inter-regional tie connecting Maritime regions of Canada and the United States became a reality during 1970 with the completion of a 345,000-volt link between the New Brunswick and Maine systems. British Columbia has an international tie with the Pacific Northwest (500,000 volts) and a 230,000-volt link between Manitoba and the United States was completed during 1970.

The search for economies in transmission systems has led to changes not only in materials used but also in tower erection and cable-stringing methods. Guyed V-shaped and Y-shaped transmission towers are being used increasingly in place of self-supporting towers where the terrain is suitable, and erection costs are being reduced by the use of helicopters to transport tower sections to the site for tower assembly. The use of helicopters for spraying in brush control on the right-of-way and for line inspection and maintenance is widespread.

In addition to considering the economics of transmission development, a concentrated effort is under way to provide systems that are acceptable from an aesthetic viewpoint. For example, investigations into the design of more attractive towers have led to the development of new tapered aluminum poles which will ultimately replace their unsightly wooden counterparts. Discretion is also being exercised in the selection of routes for proposed lines to ensure only minimal disturbance of the natural landscape.

### Subsection 6.—Research in the Field of Electricity

Developing solutions to electric power problems, especially to those of urgent significance to Canada, requires competent and well-chosen research activity. Although most research work in this area in Canada is performed by the major utilities, their ultimate contribution is not limited to their own individual needs but is of benefit to the entire electrical utility industry.

Ontario Hydro has a long history of research activity at its Dobson Laboratories, which were first established in 1912. Since then, the Commission's research facilities have grown appreciably and today its Research and Development Division employs more than 300 people and makes use of highly sophisticated equipment. The Division tackles numerous problems, not only those related to operating a large utility but also those involving the design and development of new ideas and equipment. In such endeavours, close liaison between industry and the universities is maintained. Notable achievements have been made by the Division in recent years with respect to the improvement of transmission-line appearance, the economic utilization of electric heating, the elimination of air pollution and the improvement of system reliability.

More recently, Hydro-Quebec has embarked upon the establishment of an ambitious research centre—Hydro-Quebec Institute of Research (IREQ)—which will have the function of providing a sound technological basis for Quebec's electrical utility expansion and at the same time will provide research and testing facilities for other utilities and for electrical equipment manufacturers throughout Canada. Recognizing this national role, the Government of Canada has provided substantial financial support to the Institute. An important feature of the Institute is that it has been designed to concentrate on areas where other North American research programs are inadequate or where its own facilities are superior. At the end of 1970, the first of three buildings housing general laboratories, staff offices, computers, workshops, a library and an auditorium, had been completed. Two other buildings, to be completed by 1972, will contain high-voltage and high-power laboratories.

The future will show that Canada possesses substantial capability in facilities and skilled personnel to meet the research needs of the electrical utilities and the associated manufacturing industry. There remains a challenging task for the entire industry to ensure that skills and equipment are directed in the most effective and timely way toward the solution of the most urgent and rewarding problems.

## Section 2.—Progress in Construction of Generating Facilities, 1970

The addition of 3,081,000 kw. to electrical generating capacity in 1970 raised the total installed capacity to 42,629,000 kw., an increase of 7.8 p.c. over 1969. Although this increase in the country's over-all generating capacity was significant, the total addition was nearly 20 p.c. less than the 3,840,000 kw. added in 1969.

Of the 1970 addition, thermal-electric capacity accounted for 59 p.c. or 1,810,000 kw. and hydro generation for the remaining 1,271,000 kw., so that at the end of the year total installed capacity was 66 p.c. hydro-electric and 34 p.c. thermal.

The trend to larger-sized units continued in 1970, especially with respect to thermal-electric capacity where 95 p.c. of the increase was made up of units of 150,000 kw. or greater; only 63 p.c. of the total hydro-electric addition came from units of 150,000 kw. or larger. Increases in the size of hydro-electric units cannot be expected to keep pace with thermal units since their size is influenced by head and flow as well as by consideration of system size.

**Newfoundland.**—The power industry in Newfoundland (including Labrador) recorded a remarkable 30-p.c. increase in installed generating capacity and extended substantially its transmission network. The unusually high increase in capacity resulted from the completion of two 76,500-kw. hydro units at Bay d'Espoir and the installation of a 150,000-kw. steam-generating unit at Holyrood. Although this brought to a close the present development program at Bay d'Espoir, another 150,000-kw. unit is expected to be added to the Holyrood plant in 1971. Further generation expansion on the Island of Newfoundland will probably take place on the western side but, in the light of the substantial additions currently being made, this expansion may not be required before 1976. The extension of the province's transmission system included the completion of a second 230-kv. circuit from Holyrood to St. John's. A second 230-kv. circuit to the west coast of the Island is planned for early construction. In addition, more than 150 circuit miles of 69-kv. line were built, providing connection to areas previously served only by isolated diesel generation. As the system is expanded, the diesel units will be phased out gradually.

In Labrador, work on the massive Churchill Falls development continued on schedule; by 1972 this development will begin to feed power to Quebec over the 735-kv. transmission system and by 1976 all 11 475,000-kw. generators will be in service, providing a total capacity of 5,225,000 kw. The excavation of the underground powerhouse was completed during 1970 and the installation of the turbines and generating equipment started about mid-year. The first two units will be in operation for test purposes during 1971.

**Prince Edward Island.**—Although no additions to installed capacity were made during 1970 in Prince Edward Island, a 14,000-kw. gas turbine under construction at Borden will provide an 18-p.c. increase in the province's generating capacity by the end of 1971. Load growth during 1970 produced a 10-p.c. increase in peak demand.

**Nova Scotia.**—Following a major increase in its thermal generating capacity in 1969, the Nova Scotia Power Commission made no new additions during 1970 but plans to bring a 25,000-kw. gas-turbine plant into service at Tusket in 1971 and to add another 150,000-kw. unit to its Point Tupper station in 1973. When completed, the Point Tupper station will be the largest in the province. Current expansion plans of the Nova Scotia Light and Power Company centre on the extension of the Tufts Cove station where a new 105,000-kw. unit is expected to be in service by mid-1972, bringing the station's capacity to 205,000 kw. During 1970, additions of 152 circuit miles were made to 69-kv., 138-kv. and 230-kv. systems.

**New Brunswick.**—No additions were made to generating capacity in New Brunswick in 1970, following the substantial extensions made in 1968 and 1969 at the Mactaquac and Dalhousie stations. A fourth 100,000-kw. unit for Mactaquac is scheduled for service in 1972 and two other units of the same size will follow some time later. For the most part, efforts during 1970 were concentrated on transmission development. A significant achievement was the New Brunswick Electric Power Commission's 345-kv. transmission interconnection with utilities in New England, providing the first major inter-regional tie between the Maritime regions of Canada and the United States. This interchange implemented a 25-year pact agreed upon by Canadian officials and representatives of New England power companies at Fredericton in August 1969. Under construction and planned for service in 1972 is a HVDC back-to-back asynchronous tie with 320,000-kw. capacity between New Brunswick and Quebec. This is being installed at Eel River, N.B., and will initially permit the purchase of substantial quantities of Churchill Falls power in the period up to 1976.

**Quebec.**—A total 1970 net increase of over 808,000 kw. retained for Quebec its position as the largest among the provinces in installed generating capacity. As at Dec. 31, 1970, combined hydro and thermal capacity in the province was above 14,000,000 kw. and of that total, almost 95 p.c. was hydro-electric.

The only significant addition during 1970 was the completion of the first five 161,500-kw. Manic 5 units, which added 807,500 kw. of new capacity—over 60 p.c. of Canada's hydro-electric additions for the year. The station's three remaining units are scheduled for service in 1971. Unlike many other provinces which have come to rely on thermal generation to meet their future needs, Quebec expansion plans still concentrate heavily on hydro generation. In fact, the only notable thermal station under way at present is the 250,000-kw. nuclear-fuelled Gentilly development. This unit reached criticality during 1970 and will be on line sometime in 1971. Between 1973 and 1978, Hydro-Quebec plans to install 1,212,000 kw. of additional hydro-electric capacity. The Manic 3 development will account for 1,176,000 kw. and the remainder will be supplied by an addition to the Rapide des Îles plant. In the 1972-76 period, most of the load growth will be met by purchases from the Churchill Falls complex. Extensive investigation is continuing into the engineering and economic possibilities of developing the hydro-electric potential of several rivers flowing into James Bay from northwestern Quebec. Potential exceeding 10,000,000 kw. can be developed and a decision to start in 1971 would probably produce first power in 1978-80. A pumped storage facility at Lac St. Joachims, near Quebec City, is also being given consideration.

Considerable work was carried out during 1970 on extending the transmission network throughout the province. Development of Hydro-Quebec's 735-kv. system was continued with the completion of the third of four sections connecting the Manic-Outardes complex with Montreal; by year-end, 1,022 miles of the initial program for 1,228 miles had been completed. Construction also proceeded on three additional 735-kv. circuits which will transmit energy from Churchill Falls and form a part of the integrated system. Hydro-

*The Daniel Johnson Dam at Quebec Hydro's Manic 5 development will eventually impound a vast reservoir covering 750 sq. miles. The power station, with its eight 161,500-kw. units, is now in service. Manic 5 is the largest part of the Manicouagan-Outardes complex in northeastern Quebec which, on completion, will consist of seven new power centres with a total installed capacity of 5,540,000 kw.*

Quebec will take delivery of this energy at the Labrador border about 152 miles north of Sept Îles. Three lines will extend from the delivery point, two going to Manicouagan and the third connecting with Micoua. Because of this additional supply from Churchill Falls, preparatory work is under way on expanding the 735-kv. system from Manic-Outardes to the various load centres. In addition to the 735-kv. transmission achievements, noticeable additions were made to the 315-kv., 230-kv., 120-kv. and 69-kv. systems during 1970.

**Ontario.**—Again in 1970, Ontario made a substantial increase in its over-all generating capacity. Thermal-electric additions continued to dominate the province's growth program, accounting for over 80 p.c. of the year's increase. As a result, the total installed thermal capacity in Ontario, for the first time, exceeds the total installed hydro capacity. The highlight of the year was the completion of the final two 500,000-kw. steam units at Lambton. This is now the second largest thermal station in Canada, exceeded only by Ontario Hydro's Lakeview station. In addition, three of the six 7,500-kw. gas-turbine auxiliary units at Pickering were brought into service with the remaining three scheduled for service in 1971. The commissioning of the 203,000-kw. Wells generating station on the Mississagi River was the only significant hydro-electric addition during 1970.

Continuing the present trend, expansion over the 1971-78 period will concentrate almost exclusively on thermal-electric generation. Of the 11,950,000 kw. of capacity to be added, only 228,000 kw. will be hydro-electric. Most of new thermal generation will be supplied by four plants under construction in 1970: the 4,000,000-kw. Nanticoke coal-fired plant located near Port Dover, the 2,295,000-kw. Lennox oil-fired development being built west of Kingston, and two nuclear-fuelled plants—the 2,160,000-kw. Pickering plant near Toronto and the 3,200,000-kw. Bruce development near Kincardine. Each of these stations will have units in the 500,000-kw.-to-800,000-kw. size range. The 228,000-kw.

Lower Notch station being constructed on the Montreal River is the only hydro-electric development planned for the foreseeable future. It is expected that this station will be in service by late 1971.

The nearly 1,500 circuit miles of transmission line that were added during 1970 included the completion of the last section of the double-circuit 230-kv. interconnection between the East and West Systems of Ontario Hydro.

**Manitoba.**—The first phase of the massive 1,224,000-kw. Kettle hydro-electric station on the Nelson River went into service in 1970 with the completion of the first 102,000-kw. unit. The unit was connected to the system by AC transmission in December. Completion of the  $\pm 450$ -kv. HVDC transmission system and three more generators at Kettle are scheduled for 1971 and subsequent units will be brought into service between 1972 and 1976 at the rate of two a year. The only additional expansion in the province under way in 1970 was the 33,750,000-kw. addition to the Kelsey station. This work should be finished by 1972. An interim licence, permitting control over the outflow of Lake Winnipeg by 1974, was granted to Manitoba Hydro during the year. This will allow a partial solution to the water storage requirement for economical expansion of power generation on the Nelson River system. Means for the diversion of water from the Churchill River into the Nelson system and for additional storage were under study.

A 230-kv. transmission interconnection with the United States was completed in mid-1970 to permit power sales during the summer months. Reinforcement of 230-kv. transmission to Ontario and Saskatchewan is planned for 1972 to handle projected power sales to these provinces.

**Saskatchewan.**—A major 150,000-kw. addition to the Boundary Dam generating plant raised that station's capacity to 432,000 kw., the largest in the province. A further 150,000-kw. unit is expected to be brought into service in 1973. Other generation plans include the addition of a 100,000-kw. unit to the 141,000-kw. Queen Elizabeth station and the purchase of 100,000 kw. from Manitoba in 1972. Later expansion will involve considering the alternatives of lignite-coal-burning thermal plants, gas turbines and hydro developments. The Saskatchewan Power Corporation disposed of its 25,000-kw. Moose Jaw thermal station during 1970; it had not been used since 1968.

An extensive program of transmission expansion undertaken during 1970 resulted in the addition of 168 circuit miles of 72-kv. line and 28 circuit miles of 138-kv. line. Also, arrangements were concluded with Manitoba for a second 230-kv. inter-system connection; completion of the transmission line, which will extend from Roblin in Manitoba to Yorkton in Saskatchewan, is predicted for 1972.

**Alberta.**—The commissioning of the first units at two new steam-turbine generating plants, a 300,000-kw. unit at Calgary Power's Sundance station and a 165,000-kw. unit at the Edmonton Power's Clover Bar station, assisted in raising Alberta's installed thermal capacity by over 30 p.c. in 1970. Other thermal-electric increases were made by Northland Utilities and Canadian Utilities but the latter's 30,000-kw. gas-turbine addition at Rainbow Lake was the only substantial item. No new hydro-electric capacity was added in 1970.

Future commitments in the province include Canadian Utilities' 140,000-kw. steam-turbine generator set at the H.R. Milner station near Grande Cache which is scheduled for service in 1972, and second units of 165,000 kw. and 300,000 kw. for Clover Bar (1973) and Sundance (1974), respectively. The only hydro-electric development firmly committed is the 108,000-kw. Bighorn generating station and multi-purpose water-storage project to be completed in 1972. However, the Alberta Government has under study four sites on the Peace and Slave Rivers which may provide future hydro-electric generating capacity for the provincial growth. The capacity available could exceed 2,000,000 kw. and would take advantage of the storage behind the Bennett Dam in British Columbia.

In aggregate, 347 miles of transmission line were added to the province's over-all network during 1970. Canadian Utilities added 113 circuit miles of 72-kv. and 144-kv.

*The Kettle Rapids power project nearing completion on the Nelson River in Manitoba. The first four 102,000-kw. generators of this massive development went into service in 1970 and 1971 and two additional units will be added each year from 1972 to 1976.*

*George Hunter*

*Churchill Falls powerhouse under construction in solid rock almost 1,000 feet below the surface. Diverted water from a man-made reservoir more than one third the area of Lake Ontario will funnel down eleven inclined penstocks to this huge powerhouse, through eleven massive turbines and out again to the lower Churchill River.*

*Churchill Falls (Labrador) Corporation Ltd.*

lines and Northland Utilities extended its 144-kv. system by 95 circuit miles. In view of the increased load that will result from further expansion of Lake Wabamun generation, Calgary Power plans to augment its 240-kv. transmission grid in the Wabamun-Edmonton-Calgary corridor in the near future.

**British Columbia.**—Only minor additions were made to generating capacity in British Columbia in 1970 but three more 227,000-kw. units will be added to the Portage Mountain development in 1971-72 and a further 200,000-kw. addition will result from the redevelopment of the Jordan River and Whatshan plants. An extensive study of provincial power requirements to 1985 is under way by the B.C. Energy Board in co-operation with B.C. Hydro and provincial government departments. Transmission expansion includes the final stages of the second 500-kv. line between Portage Mountain and Vancouver, extension of the 230-kv. East Kootenay transmission line to interconnect with the United States, and reinforcement in North Vancouver Island with 138/230-kv. circuits. Construction of the Columbia River storage facilities is continuing, the main Canadian effort at Mica Creek being scheduled for operation in early 1973.

**Yukon Territory.**—Additions to generating facilities during 1970 totalled 7,410 kw.; however, since 1,150 kw. were removed, the net increase amounted to only 6,260 kw. The prime increase was a 5,150-kw. diesel generator placed in service at the Whitehorse station. Other lesser additions were a 500-kw. unit at Clinton Creek, a 600-kw. unit at Watson Lake and a total of 1,160 kw. at various plants throughout the Territory. Installation of a 5,150-kw. unit at Faro commenced in 1970 and was planned for full operation by early 1971. The rapid growth in peak-load demand, which has tripled over the past decade, has necessitated studies of future transmission and generating expansion. It is anticipated that by 1975, generation will be almost double the 1970 level.

**Northwest Territories.**—The Yellowknife and Frobisher Bay generating stations were substantially expanded during 1970 with additions in capacity of 5,150 kw. and 4,420 kw., respectively. Northland Utilities' Hay River plant was also enlarged, bringing the station's over-all installed capacity to 3,350 kw. Immediate expansion plans in the Territories include a new 5,150-kw. internal combustion station at Pine Point and the addition of a similar unit to the Inuvik plant, both of which should be in operation by the end of 1971. Beyond this, expansion is somewhat uncertain, since load growth depends, in large measure, on the success of oil and gas exploration and on the development of mining prospects. Studies suggest that transmission development paralleling the Mackenzie River, with possible interconnection with the Yukon, could, in conjunction with large thermal or hydro developments, best meet the longer-term load growth in this extensive area.

Two significant transmission developments begun during 1970 were scheduled to be completed in 1971—an 80-mile three-phase 69-kv. line connecting Inuvik to Tuktoyaktuk, and a 40-mile single-phase line joining Pine Point with Fort Resolution.

### Section 3.—Power Generating Capability and Load Requirements

Power generating *capability*, as covered in this Section, is the measurement of the available generating resources of all hydro and thermal facilities at the time of the one-hour firm peak load for each reporting company, and is not equal to the *capacity* of such generating facilities. For example, a hydro plant may have a capacity of 100,000 kw. but if, at the time of peak load, the water available for generation is only 80 p.c. of the plant capacity requirements, then its capability is 80,000 kw.

Total generating capability has grown at a rapid rate especially in the past few decades. The annual rate of increase was 6.3 p.c. in the ten-year period 1960-70 and 9.3 p.c. in the four-year period 1966-70. In comparison, the forecast rate of growth for the years 1970-75 is 6.7 p.c.; thermal generating capability is expected to grow at an average rate of 9.5 p.c. a year in the forecast period compared with 13.8 p.c. in the period 1960-70, and hydro-electric capability is expected to increase at 5.2 p.c. a year compared with 4.0 p.c. in the

1960-70 period. This rate of growth in hydro generating capability in the forecast period is attributable to the large power projects under construction in relatively remote areas that will be completed within the next few years.

Among the provinces, Ontario has the largest generating capability, followed by Quebec, British Columbia and Alberta. Quebec has the largest hydro-electric generating capability, followed by Ontario and British Columbia, but Ontario has the largest thermal capability, followed by Alberta and British Columbia. The first full-scale nuclear power station went into commercial operation in Ontario in early 1967.

The largest absolute growth in generating capability for the forecast years is indicated for Ontario at 5,645,000 kw., followed by Newfoundland at 4,076,000 kw., British Columbia at 1,704,000 kw. and Quebec at 1,207,000 kw. Ontario will meet most of its increased generating capability by adding 5,372,000 kw. in thermal capability and 273,000 kw. in hydro capability, the former including 2,014,000 kw. nuclear. Newfoundland will add 3,909,000 kw. hydro and 167,000 kw. thermal, and British Columbia 1,399,000 kw. hydro and 305,000 kw. thermal.

*Firm power peak load* is the measure of the maximum average net kilowatt demand of one-hour duration from all loads, including commercial, residential, farm and industrial consumers as well as the line losses. Such load demand increased at the rate of 7.1 p.c. a year from 1960 to 1970 and 7.4 p.c. a year from 1966 to 1970; peak-load demand is forecast to increase at the average rate of 6.9 p.c. a year in the period 1970-75. As a result of the rapid increase in generating capability and the somewhat slower but steady increase in the peak loads, together with the slight reduction in deliveries of firm power to the United States, the indicated reserve on net capability in the 1960-70 period increased each year except 1961, 1963, 1964 and 1966. The forecast is for increases in each year from 1970 to 1975. The reserve ratio as a percentage of firm power peak load reached a high of 28.2 p.c. in 1960 and fell to 11.6 p.c. in 1966 but is expected to increase to 18.5 p.c. in 1975.

## 2.—Net Generating Capability, by Province, 1970

(Thousand kilowatts)

Province or Territory	Type of Generating Facility				Total

<sup>1</sup> Includes 194,000 kw. of nuclear capability in Ontario.

## Section 4.—Electric Power Statistics

Electric power statistics presented in this Section are based on reports of all electrical utilities and all industrial establishments that generate energy regardless of whether or not any is sold and therefore show the total production and distribution of electric energy in Canada. Utilities are defined as companies, commissions, municipalities or individuals whose primary function is to sell most of the electric energy that they have either generated or purchased. Industrial establishments are defined as companies or individuals that generate electricity mainly for use in their own plants.

The current series of electric power statistics dates back to 1956. Earlier reports, entitled *Central Electric Stations*, were concerned solely with the electrical utility industry and hence excluded statistics relating to power produced by industrial establishments for their own use, although power sold by such establishments was included. The latest figures available at time of printing (December 1971) for Tables 5-9 were for 1969.

#### 4.—Electric Energy Generated, by Type of Station, 1961-70, and by Province 1969 and 1970

Ontario.....	61.2	38.8			

Table 5 gives summary figures of power production and distribution classified by province, and Tables 6 and 7 give figures classified by type of production establishment. Total installed capacity in Canada amounted to 39,591,841 kw. in 1969, an increase of 3,683,344 kw. over 1968. Of the 1969 total, 34,324,618 kw. were accounted for by utilities and the remainder by industrial establishments. During 1968 and 1969, total sales to ultimate customers amounted to 116,795,097,000 kwh. and 127,451,741,000 kwh., respectively, of which 99.8 p.c. in both years was sold by utilities.

Sales to power customers excluding sales to industrial establishments with generating facilities made up 49.7 p.c. of the total in 1968 and 49.4 p.c. in 1969, sales to domestic and farm customers were 32.3 p.c. and 31.7 p.c., respectively, and commercial sales 16.8 p.c. and 17.8 p.c., respectively. Exports to the United States in 1969 amounted to 4,319,551,000 kwh., an increase of 331,237,000 kwh. over 1968.

Average domestic and farm consumption rose from 6,571 kwh. in 1968 to 6,834 kwh. in 1969. Among the provinces, the averages in 1969 varied from a low of 3,565 kwh. in Prince Edward Island to a high of 8,374 kwh. in Manitoba. For domestic and farm customers the average annual bill was \$102.64 in 1969 as against \$97.52 in 1968.

Although many utilities do not keep records on farm customers separate from other domestic customers, the data reported on farm service indicate that the average consumption rose from 9,155 kwh. per customer in 1968 to 10,069 kwh. in 1969 and the average bill from \$156.26 to \$171.84.

In 1969, natural gas accounted for 11.9 p.c. of thermal generation by utilities, coal for 69.2 p.c., petroleum fuels for 17.5 p.c. and nuclear fuel for 1.3 p.c.; corresponding proportions in 1968 were 17.3 p.c., 61.4 p.c., 19.0 p.c., and 2.3 p.c., respectively.

## Section 5.—Electrical Utility Ownership and Regulation

Federal Government regulation of electrical utilities with respect to the export of electric power and the construction of lines over which such power is exported falls within the jurisdiction of the National Energy Board (see Index).

Power is generated in Canada by publicly and privately operated utilities and by industrial establishments. Table 7, p. 734, giving statistics by type of establishment shows that over 70 p.c. of the total electric power generated in 1969 was produced by publicly operated utilities, 10 p.c. by privately operated utilities and 18 p.c. by industrial establishments. However, ownership differs greatly in different areas of the country. Quebec output at one time was predominantly from privately owned plants but since 1963 has been almost entirely publicly owned. In Ontario almost all electric power has been produced by a publicly owned utility for over 60 years.

Because the determination of market prices and regulation of services is limited to inter-fuel competition with oil, gas and coal, some regulation of electrical utilities has been attempted in all provinces. In most of them the generation and main transmission of power is the responsibility of a provincial Crown corporation. Investor-owned electrical utilities are predominant in Alberta and play a significant role in Nova Scotia, Newfoundland, Prince Edward Island, Ontario and British Columbia; they contribute about 10 p.c. of the total power generated. Generating facilities in industrial establishments represented 13.3 p.c. of installed capacity at the end of 1970 and generated 16.0 p.c. of the electric energy produced during the year. There is an annual decline in industrial generation as it becomes increasingly attractive to purchase power from utilities, which can take fuller advantage of larger unit sizes and operational flexibility. Even when process steam is required for an industrial operation, there are instances when it is advantageous to purchase both steam and power from the electrical utility.

**Newfoundland.**—The Newfoundland and Labrador Power Commission was established by the provincial government in 1954 for the purpose of supplying power wherever needed throughout the province. The Commission began large-scale production of electric energy in 1967 when the Baie d'Espoir plant began operating and the provincial transmission grid was established. Power is supplied from this grid to several industries direct and to investor-owned electric distribution companies for distribution. The Newfoundland Light and Power Company is the principal distributor. Bowater Power Company Limited supplies the Bowater Newfoundland Pulp and Paper Mills Limited and several large mining operations. Electricity is provided to isolated areas through Rural Electricity Authority and Power Distribution Districts principally through diesel generator sets. In Labrador, the Churchill Falls (Labrador) Corporation, a subsidiary of Brinco, is engaged in the development of the massive Churchill Falls power project which will commence production in 1972. This company also controls the Twin Falls Power Corporation which operates a substantial generating plant in the vicinity of Churchill Falls on the Unknown River and serves iron ore mining centres in western Labrador.

**Prince Edward Island.**—The Maritime Electric Company provides service to customers in Charlottetown and in most of the towns, villages and rural areas in the province. The Company, having total assets of \$30,514,622, supplied 247,368,000 kwh. in 1970, an increase of 17 p.c. over 1969, and had an installed capacity of 70,500 kw. The town of Summerside is supplied by a municipal electric department with an installed generating capacity of 6,900 kw. It is interconnected with the Maritime Electric Company System.

**Nova Scotia.**—The self-supporting Nova Scotia Power Commission, with total fixed assets of \$200,895,782, is one of the province's largest industries. The Commission was

created under the Power Commission Act of 1919 to develop the limited but useful hydro potential of the province, as investigated by the Water Power Commission in 1915, and to control exploitation of the province's rivers. The first objective was to develop remote hydro sites to supply energy at the lowest possible cost to new industries, particularly pulp and paper, and a few centres of population. The 1937 Rural Electrification Act, however, provided equalization grants and made it possible to carry out the formidable task of bringing power and energy to low-density farm and rural village areas. The Commission now employs about 1,200 full-time personnel and its operating revenues in the year ended Mar. 31, 1970 amounted to \$34,000,000. Deliveries in that year were 26 p.c. higher than in 1968-69, most of the growth being comprised of service to new and expanded industry.

Almost 7,000 miles of transmission and distribution lines conduct the energy generated by 513,000-kw. capacity to and from every corner of the province. Most of the hydro potential of Nova Scotia has been developed so that emphasis has now been placed on thermal production for future power needs.

#### 10.—Capacity and Output of the Nova Scotia Power Commission, Year Ended Mar. 31, 1971

<sup>1</sup> Hydro unless otherwise noted.

**New Brunswick.**—The New Brunswick Electric Power Commission was incorporated under the Electric Act, 1920. Generating stations owned by the Commission at Mar. 31, 1970 were as follows:—

<i>Plant</i>	<i>Type</i>	<i>Capacity</i>	<i>Plant</i>	<i>Type</i>	<i>Capacity</i>
		kw.			kw.
Grand Falls.....	Hydro	60,500	Grand Lake.....	Steam	100,000
Musquash.....	Hydro	7,500	Saint John (Dock St.)...	Steam	16,785
Tobique.....	Hydro	20,000	Chatham.....	Steam	36,155
Beechwood.....	Hydro	115,000	Grand Manan.....	Diesel	2,811
Milltown.....	Hydro	3,900	Mactaquac.....	Hydro	320,000
Sisson.....	Hydro	9,500	Dalhouseie.....	Steam	100,000
Courtenay Bay.....	Steam	269,300			
			TOTAL CAPACITY.....		1,061,451

All the foregoing generating units with the exception of Grand Manan are interconnected in a province-wide grid system. The statistical information given in Table 11 shows the growth of the Commission's undertakings since 1966.

The provincial electric power system is interconnected with an extensive high-voltage transmission system and, with the utilities in Nova Scotia, forms part of the Maritime Power Pool. At the end of 1970, construction was under way on important interconnections with Hydro-Quebec and with utilities in the New England States. These interconnections will provide improved opportunities to meet the growing load requirements in the most economic fashion, not only in New Brunswick but throughout the Maritime Power Pool.

**Quebec.**—*Stream and Reservoir Control.*—The Quebec Streams Commission was created in 1910 (SQ 1910, c. 5) and given additional powers in 1912 (RSQ 1925, c. 46) and 1930 (SQ 1930, c. 34); it was authorized to ascertain the water resources of the province, to make recommendations regarding their control and to construct and operate certain storage dams to regulate the flow of streams. In 1955, the Commission was abolished and its powers and attributions transferred to the Hydraulic Resources Department, now the Department of Natural Resources. The rivers controlled by the Commission at the time of transfer, either by means of dams on the rivers or by regulating the outflow of lakes at the headwaters, were: the St. Maurice, the Gatineau, the Lièvre, the St. Francis, the Chicoutimi, the Au Sable and the Métis. The Commission also operated nine reservoirs on the North River, two in the watershed of the Ste. Anne de Beaupré River and one at the outlet of Lake Morin on Rivière du Loup (lower). In 1965, eleven auxiliary reservoirs on the St. Maurice System and two on the Gatineau were turned over by the Department of Natural Resources to the Quebec Hydro-Electric Commission for operation and maintenance.

Storage reservoirs otherwise controlled or operated are: the Lake St. John, the Lake Manouane and Passe Dangereuse on the Peribonca River controlled by the Aluminum Company of Canada; the Onatchiway on the Shipshaw River controlled by Price Brothers and Company Limited; Memphremagog Lake on the Magog River controlled by the Dominion Textile Company; and Témiscamingue and Quinze Lakes on the Ottawa River controlled by the federal Department of Public Works. Storage reservoirs under the control of the Quebec Hydro-Electric Commission are: Témiscouata Lake on the Mada-waska River, Kipawa Lake on the Ottawa River, Lac Dozois on the upper Ottawa River,

Lac Cassé in the Bersimis River watershed and Lac Ste. Anne on the Toulmoustou River, a tributary of the Manicouagan River.

*The Quebec Hydro-Electric Commission.*—The Quebec Hydro-Electric Commission was established in 1944 (SQ 1944, c. 22) for the purpose of supplying power to the municipalities, to industrial and commercial undertakings and to citizens of the Province of Quebec at the lowest rates consistent with sound financial administration. On May 1, 1963, the Commission acquired control of the following privately owned electrical utilities operating in the Province of Quebec: the Shawinigan Water and Power Company, the St. Maurice Power Corporation, the Quebec Power Company, the Southern Canada Power Company, the Gatineau Power Company, the Northern Quebec Power Company, the Saguenay Electric Company, and the Lower St. Lawrence Power Company. As a result of these transactions, all electricity production, except for facilities operated by certain industrial organizations in their own manufacturing operations, was brought under the control of a single authority. The services of the Commission now cover virtually the entire province except for local distribution of small amounts of electricity by some municipalities, most of which is purchased from the Commission or its subsidiaries.

At the end of 1970, Hydro-Quebec and its subsidiaries had in operation 53 hydro-electric stations having a capacity of 9,955,261 kw., and 16 thermal-electric stations having a capacity of 661,992 kw.—a total capacity in operation of 10,617,253 kw. These facilities permit the balanced distribution of power throughout Quebec and the most efficient use of the water power resources of the province. Power plant construction under way in Quebec during 1970 is outlined at pp. 726-727.

## 12.—Summary Statistics of the Operations of the Quebec Hydro-Electric Commission, 1968-70

**Ontario.**—The Hydro-Electric Power Commission of Ontario is a corporate entity, a self-sustaining public enterprise endowed with broad powers with respect to the supply of electricity throughout the Province of Ontario. Its authority is derived from an Act of the Provincial Legislature passed in 1906 to give effect to recommendations of earlier advisory commissions that the water powers of Ontario should be conserved and developed for the benefit of the people of the province. It now operates under the Power Commission Act (SO 1907, c. 19) passed in 1907 as an amplification of the Act of 1906 and subsequently modified from time to time (RSO 1960, c. 300, as amended). The Commission may have from three to six members, all of whom are appointed by the Lieutenant-Governor in Council. Two commissioners may be members of the Executive Council of the Province of Ontario.

The basic principle governing the financial operations of the Commission and its associated municipal utilities is that electrical service is provided at cost. The Commission interprets cost as including payments for power purchased, charges for operating and maintaining the power-supply facilities, and related fixed charges. The fixed charges represent interest on debt, provision for depreciation, allocations to reserves for contingencies and rate stabilization, and the further provision on a sinking-fund basis for the retirement of

the Commission's capital debt. While the enterprise from its inception has been self-sustaining, the province guarantees the payment of principal and interest on all bonds issued by the Commission and held by the public. In addition, the province has materially assisted the development of agriculture by contributing under the Hydro-Electric Distribution Act toward the capital cost of extending rural distribution facilities.

The East and West Systems, which had been formerly separate operating entities, were fully integrated in 1970 and, although the capacity of the interconnection is a limiting factor in the exchange of power, the combined facilities now form a unified provincial network. Statistics for 1970 have been presented for the network as a whole, and the system components for previous years have been combined. Since 1962 the entire province has been regarded for financial and administrative purposes as a unit. For general day-to-day operations it is still divided into seven regions, with regional offices located in seven major municipalities.

The Commission is concerned primarily with the provision of electric power by generation or purchase and its delivery to more than 350 electrical utilities for resale in municipalities having cost contracts with the Commission. The Commission also supplies power in bulk, although not under cost contract, to direct customers, including industrial customers whose requirements are so large or so unusual as to make service by the local municipal utilities impracticable, mines, industries in unorganized territories, and certain interconnected systems.

In addition to these operations, which represent about 90 p.c. of its energy sales, the Commission delivers electric power to retail customers in rural areas and in a small group of 15 municipalities served by Commission-owned local distribution facilities. Retail service throughout the province is provided for the most part, however, by the municipal electrical utilities, which supply ultimate customers in most cities and towns, in many villages, and in certain populous township areas. The municipal electrical utilities are owned and operated by local commissions.

In addition to administering the enterprise over which it has direct control, the Commission, under the Power Commission Act and the Public Utilities Act, exercises certain regulatory functions, particularly with respect to the group of municipal electrical utilities that it serves.

During 1970, the Commission's investment in fixed assets at cost increased by \$489,831,744 and at the end of the year amounted to \$4,588,182,936. Assets, after deducting accumulated depreciation, were \$4,612,608,485. In that year, 353 municipal electrical utilities, engaged in the retail distribution of electricity, purchased power from the Commission. The assets of these utilities, after deducting accumulated depreciation, amounted to \$1,279,598,912, of which \$520,667,796 represented the equity acquired in the Commission's systems by the municipal utilities operating under cost contracts.

### 13.—Power Developments of The Hydro-Electric Power Commission of Ontario, under Construction or Approved as at Dec. 31, 1970

Development and Location	Units	In-Service Dates	Total Installed Capacity
	No.		kw.
Fossil-Fuelled Thermal-Electric—			
Nanticoke-Lake Erie, near Port Dover (coal).....	8	1971-77	4,000,000
Lennox-Lake Ontario, near Kingston (oil).....	4	1974-77	2,295,000
Nuclear-Fuelled Thermal-Electric—			
Pickering-Lake Ontario, east of Toronto.....	4	1971-73	2,160,000
Bruce-Lake Huron, near Kincardine.....	4	1975-78	3,200,000
Combustion-Turbine—			
Pickering.....	6	1971-72	45,000
Bruce.....	—	1975	45,000 <sup>1</sup>
Hydro-Electric—			
Lower Notch-Montreal River.....	2	1971	228,000

<sup>1</sup> Tentative.

#### 14.—Resources of The Hydro-Electric Power Commission of Ontario Generated and Purchased, December 1969 and 1970

As at December—	Hydro- Electric Stations <sup>1</sup>	Thermal- Electric Stations <sup>1</sup>	Power Purchased
	kw.	kw.	kw.
1969.....	5,753,500	4,757,000	731,300
1970.....	5,965,600	6,318,000	385,900

<sup>1</sup> Dependable peak capacity—the amount of power which resources can be expected to supply at the time of the system primary peak requirements, assuming that all units are available and that the supply of water is normal. This capacity will vary from time to time in accordance with changing conditions. The capacity of a source of purchased power is based on the terms of the purchase contract.

#### 15.—Growth of The Hydro-Electric Power Commission of Ontario, 1961-70

Year	Ultimate Customers Served Directly or Indirectly	Total Power Distributed <sup>1</sup>	Assets of Commission and Municipal Utilities
	No.	kw.	\$
1961.....	1,938,897	6,463,932	3,196,429,522
1962.....	1,991,289	6,968,885	3,148,330,722
1963.....	2,041,732	7,300,296	3,225,289,707
1964.....	2,095,754	7,688,790	3,331,568,632
1965.....	2,142,281	8,348,407	3,533,238,103
1966.....	2,187,767	8,839,455	3,777,633,871
1967.....	2,245,715	9,429,075	4,071,817,215
1968.....	2,292,015	10,138,586	4,424,172,463
1969.....	2,343,807	11,057,321	4,848,001,515
1970.....	2,388,561	11,609,274	5,371,539,601

<sup>1</sup> Sum of the maximum 20-minute coincident peak loads (primary plus secondary) of each of the systems operated by the Commission, given in terms of net output of the sources of supply to each system for the last month of each fiscal year.

In addition to the Ontario Hydro province-wide system, a few investor-owned utilities provide service to customers in Cornwall, Fort Erie, Gananoque and Sault Ste. Marie.

**Manitoba.**—Manitoba Hydro is the primary developing, generating and distributing power agency in the Province of Manitoba. The corporation came into being Apr. 1, 1961, following amalgamation of the two former provincial government utilities engaged in the generation and distribution of electric power.

Manitoba Hydro operates eight hydro-electric generating stations, two thermal-electric generating stations and 27 small diesel-electric generating plants. The combined generating capability is 1,615,448 kw., hydro installations accounting for 1,196,000 kw., thermal installations for 399,750 kw. and diesel installations for 19,698 kw. Four hydro stations are located on the Winnipeg River near Winnipeg, one is on the Saskatchewan River 285 miles north of Winnipeg, two are on the Nelson River 450 miles northeast of Winnipeg and one on the Laurie River where the responsibility for supply to Sherritt Gordon Mines and the towns of Fox Lake and Lynn Lake were assumed by Manitoba Hydro in May 1970. All eight hydro stations and the thermal generating stations at Selkirk and Brandon are electrically interconnected to a common network known as the Manitoba Integrated System. Diesel installations are used to provide power to isolated northern communities where extension of hydro-electric transmission facilities is not feasible. Construction under way in 1970 is outlined at p. 728.

Manitoba Hydro serves over 600 communities and 242,296 consumers in rural Manitoba and suburban Winnipeg through a network of 37,493 miles of transmission and farm

distribution lines. The Winnipeg Hydro Electric System distributes power within the corporate limits of the city of Winnipeg. A portion of this power is generated by the city system from its own hydro and thermal plants and the remainder is purchased from Manitoba Hydro.

**Saskatchewan.**—The Saskatchewan Power Corporation was established in 1949 by the Power Corporation Act (RSS 1965, c. 40, as amended). It succeeded the Saskatchewan Power Commission which had been in operation since 1929. The original functions of the Corporation included the generation, transmission and distribution, sale and supply of electric energy. The objective was to make electricity available to all the people of the province, in abundance and at reasonable rates. Since 1952, the Corporation has been authorized to produce or purchase and to transmit, distribute, sell and supply natural or manufactured gas.

In 1970, the Corporation served 130 communities with 500 population or over, 872 smaller communities and 94 summer resorts. In addition, bulk power was supplied to the cities of Saskatoon and Swift Current and the town of Battleford. A subsidiary company, North-Sask Electric Ltd., has the responsibility for providing and improving electrical service to communities in northern Saskatchewan.

At the end of December 1970, the Corporation served approximately 271,000 customers composed of 201,648 "urban" (defined as one in which there are at least six customers) and 69,352 "rural" customers. Energy sales reached 4,600,000,000 kwh. with industrial customers accounting for 41 p.c. and residential customers for 17 p.c. of the total. During 1970, 5,100,000,000 kwh. was supplied to the system, almost all of it generated in Corporation plants. Coal accounted for 44 p.c. and hydro for 38 p.c. of the energy sources. In December, the provincial peak load reached 1,000,000 kw., for the first time. The Corporation owned and operated 5,148 miles of 72-kv.-and-over transmission lines and 71,463 miles of less than 72 kv. (excluding urban distribution).

At the end of 1970, the Corporation had invested, at cost, \$529,900,000 in electrical system assets out of a total plant-in-service investment of \$726,100,000.

#### 16.—Growth of the Saskatchewan Power Corporation, 1961-70

Year	Seasonal Gross System Peak Load	Individual Meters in Communities Served	Power Distributed <sup>1</sup>	Revenue
	kw.	No.	kwh. x 10 <sup>3</sup>	\$'000
1961.....	370,000	229,336	1,498,056	30,263
1962.....	424,700	235,386	1,645,862	33,106
1963.....	471,000	240,812	1,926,863	36,893
1964.....	539,500	246,389	2,208,150	39,778

1969.....	956,000	317,525	4,635,500	67,020
1970.....	1,066,000	318,909	5,119,500	72,387

<sup>1</sup> Power distributed = net system kwh. (net generated plus net purchased).

**Alberta.**—The generation and distribution of electric power in Alberta is handled by two major investor-owned company groups and three municipal utilities. Several other municipal systems handle local distribution of power purchased from the investor-owned utilities. The Alberta Power Commission which acted as a regulatory body for the electrical utility industry in the province but with no facilities of its own, ceased to exist on May 31, 1971; its functions were taken over in large part by the Energy Resources Conservation Board.

### 17.—Statistics of Companies or Municipalities Providing Central Station Electrical Service in Alberta, 1970

Ownership and Company or Municipality	Net Capability as at Dec. 31	Net Peak Load during 1970	Net Generation during 1970
	kw.	kw.	'000 kwh.
<b>Privately Owned</b>			
Calgary Power Ltd.....	1,535,000	1,190,700	5,559,244 <sup>1</sup>
Canadian Utilities Ltd. and Northland Utilities Ltd.....	356,260	315,560	1,405,639

**British Columbia.**—The British Columbia Hydro and Power Authority is a corporation and an agency of the Crown in right of the Province of British Columbia. B.C. Hydro operates an extensive system of public utility services. Electric energy is generated,

transmitted and distributed throughout areas of the province containing more than 90 p.c. of the population. Natural gas is purchased and distributed in Greater Vancouver and in the Fraser Valley eastward to Hope, and liquefied petroleum gas is distributed in Greater Victoria. B.C. Hydro operates three transportation services: an urban passenger transportation system serves Greater Vancouver and Greater Victoria; an interurban passenger transportation system serves Greater Vancouver, the Fraser Valley eastward to Hope, between Vancouver and Victoria and between Vancouver and Nanaimo (via ferries of the British Columbia Ferry Authority); and a rail freight system serves Greater Vancouver and the Fraser Valley eastward to Chilliwack.

Of B.C. Hydro's total electric power requirements of 16,564,000,000 kwh. for the year ended Mar. 31, 1971, 14,265,000,000 kwh. or 86 p.c. were produced by hydro-electric stations and 1,536,000,000 kwh. and 9 p.c. by thermal plants; the remaining 763,000,000 kwh. were purchased primarily from Canadian sources. Kilowatt-hours of electricity sold during 1970-71 (14,833,000,000) were 7.6 p.c. higher than during the previous year, with gains recorded for all categories of customers. Residential consumption moved up 12.7 p.c., commercial 10.7 p.c., and industrial 4.4 p.c.; the latter is a sharp decline from the previous year's increase of 11.6 p.c., mainly as a result of labour disputes. At Mar. 31, 1971, the number of customers served with electricity totalled 690,000, an increase of 38,000 during the year. The average annual rate for residential customers remained at 1.9 cents a kilowatt-hour, and the average annual residential consumption increased from 6,651 kwh. to 6,949 kwh.

*Mica Dam on the Columbia River, 85 miles north of Revelstoke, B.C., nearing its crest height of 800 feet. Final earth-filling in 1972 will complete placement of nearly 43,000,000 cubic yards of fill and first water behind the structure will gather in the spring of 1973. The powerhouse on the site will house six generators with a total capacity of 2,600,000 kw.*

**18.—Summary Statistics of the British Columbia Hydro and Power Authority,  
Year Ended Mar. 31, 1971**

**Yukon and Northwest Territories.**—The Northern Canada Power Commission, a Crown corporation established in 1956, operates under authority of the Northern Canada Power Commission Act (RSC 1970, c. N-21) which empowers it to survey utility requirements, construct, and operate public utility plants in the Northwest Territories, Yukon Territory and, subject to the approval of the Governor General in Council, elsewhere in Canada. It is a requirement of the authorizing Act that projects undertaken by the Commission shall be self-sustaining; consequently rates charged for utilities supplied must provide sufficient revenue to cover interest on investment, repayment of principal over a period of years, operating and maintenance expenses, and a contingency reserve.

The Commission has hydro-electric power developments on the Yukon River near Whitehorse and on the Mayo River near Mayo in the Yukon Territory; in the Northwest Territories, it has developments on the Snare River northwest of Yellowknife and the Taltson River northeast of Fort Smith.

The 5,100-kw. Mayo River hydro-electric development has supplied power to mining properties in the Elsa and Keno areas and to the communities of Mayo and Keno City since 1952. The Whitehorse Rapids power development (hydro capacity 19,000 kw.), in service since 1958, supplies power to the Yukon Electrical Company for distribution in the city of Whitehorse and to a copper mining operation located within a few miles of Whitehorse. A 225-mile transmission line, completed in 1969, supplies the Anvil Mining Corporation Limited's lead and zinc mine mill complex at Faro in the Vangorda Creek area. A 9,000-kw. peaking standby diesel-electric generating plant, situated adjacent to the hydro-electric plant at Whitehorse, was commissioned in December 1968, and an additional 5,000-kw. diesel-electric plant was installed in 1970. Also, in 1970, a 5,000-kw. diesel-electric plant was installed at Faro, near the Vangorda Creek end of the 225-mile transmission line.

The two Snare River hydro-electric power developments (total capacity 14,000 kw.), commissioned in 1948 and 1960, supply power to the gold mines in the Yellowknife area, the city of Yellowknife, and the communities of Rae/Edzo. These two plants are operated by remote control from Yellowknife and have been supplemented by a 5,000-kw. diesel-electric

plant in Yellowknife, completed in 1970. The Taltson River hydro-electric plant is an 18,000-kw. development supplying the lead-zinc mining and milling operation at Pine Point and the communities of Fort Smith, Pine Point and Fort Resolution, N.W.T. This plant is operated by remote control from Fort Smith. A 5,000-kw. diesel-electric plant was completed in 1970 at Pine Point.

Diesel-electric power plants are operated by the Commission at Aklavik, Coppermine, Tuktoyaktuk, Fort Norman, Fort Franklin, Cambridge Bay, Fort Good Hope, Norman Wells, Chesterfield Inlet, Baker Lake in the Northwest Territories, at Dawson in the Yukon Territory, and at Field in British Columbia. The Commission also operates and maintains utility plants comprising electric power, central heat, water and sewerage services at Inuvik, Frobisher Bay, Fort McPherson and Fort Simpson in the Northwest Territories and Moose Factory in Ontario, and operates the water and sewerage systems at Dawson in the Yukon Territory.

Investor-owned generation provides electric power service to several regions within the Territories. In the Yukon Territory, Yukon Electrical Company Limited has generation facilities near Whitehorse and several isolated diesel plants. In addition, the Company provides distribution of electric power in Whitehorse, Carmacks, Carcross and Keno Hill with supplies purchased from the Northern Canada Power Commission. In the Northwest Territories, Plains Western Gas and Electric Co. Ltd. distributes power (supplied by NCPC) in Yellowknife; Northland Utilities has generation and distribution facilities in Hay River, Fort Providence and Enterprise.

---

Subsection 4. Size of Manufacturing Establishments Based on Employment and Shipments.....	764	Subsection 2. Provincial Assistance to Manufacturing.....	785

*The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.*

Section 1 of this Chapter contains a summary of the regularly issued statistical data on the manufacturing industries of Canada, based on the annual Census of Manufactures and on monthly and quarterly surveys. Section 2 is a special study on the trends in the number of manufacturing establishments.

### Section 1.—Statistical Data on Canadian Manufacturing Industries

Statistics on the manufacturing industries are issued by Statistics Canada on an annual, monthly and quarterly basis, depending on the type of data. The basic annual data are the results of the annual Census of Manufactures. Among the monthly figures available, two important sets of data provide a basis for projecting figures of the annual Census of Manufactures—the monthly survey of manufacturers' shipments, inventories and orders, and monthly estimates of employees by industry.

The monthly shipments, inventories and orders series is published for the manufacturing industries of Canada and the provinces, with breakdowns by industry group and by selected industry in the case of the totals for Canada. They are based on a survey of respondents to the annual Census and are projections of the Census total, with the qualification that new entries into the manufacturing industries since then are not covered. (This contributes to the tendency shown by monthly shipments figures, for instance, to fall slightly below those of the subsequent annual Census for the same year.) The monthly estimates of employees by industry provide figures on total employees in the manufacturing industries for Canada and the provinces, each classified into durable and non-durable industries. Like the monthly shipments survey, the figures are based partly on statistical sampling. Both sets of monthly figures also yield totals for the calendar year, while the annual Census includes some reports made on a respondent's fiscal year differing from the calendar year. (The effect of this is not large.)

These data relate to establishments—roughly corresponding to the popular conception of a plant, factory or mill—and, for certain statistics, to non-manufacturing units known as "head offices, sales offices and auxiliary units". For some purposes, companies rather

\* Except where otherwise indicated, this Chapter was prepared in the Manufacturing and Primary Industries Division, Statistics Canada.

than plants or factories are of interest. For example, a company owning factories, mines and merchandising outlets will normally report its profit for the whole company rather than divide it among the different industrial activities in which it is engaged. Thus, the quarterly survey of corporation profits provides figures on sales, profits and certain other statistics for whole companies classified to industries on the basis of their principal activities (for instance, factories might be included in mining or mines in the manufacturing industry). Such figures are generally not comparable with establishment statistics.

Various other monthly and quarterly surveys relate to commodities rather than to establishments or companies. That is, they account for production or shipments of particular products without regard to the industry in which they are produced.

In addition to providing estimates of over-all employment in manufacturing (and other industries), monthly surveying of employment, hours and payrolls results in indexes of employment for larger establishments by industry and by province and sub-provincial area, and in data on average hours and earnings. Monthly indexes of industrial production provide measures of the physical volume of output of the manufacturing industries. That is, they measure output, net of the effects of price changes. These indexes afford annual averages which can be used to indicate movement in the real domestic product at factor cost originating in the manufacturing industries. In addition, many users find valuable information in the large number of monthly industry selling price indexes for various manufacturing industries.

### Subsection 1.—Post-Census Data on Manufacturing

This Subsection is included to give some preliminary data for 1970 and 1971 based on monthly or quarterly surveys, since the results of the Census of Manufactures for 1970 were still in the processing stage at the time of preparation of this Chapter. Some factors influencing the levels of current and annual Census figures in comparison with each other are indicated in the preceding text.

Table 1 compares the value of shipments of goods of own manufacture, by province, for the year 1970 (from a monthly survey\*) with data for 1969 and earlier censuses, and Table 2 makes similar comparisons for industry groups. Table 3 gives estimates of annual averages of employees in Canadian manufacturing industries by province for 1969 and 1970 compared with the preliminary 1969 Census of Manufactures totals for the provinces and the Yukon and Northwest Territories. Table 4 gives company data on profitability in various manufacturing industry groups for the years 1963-70; because these figures† relate to companies and those of the Census of Manufactures relate to establishments (roughly speaking, plants), the two series are of limited comparability.

### Subsection 2.—Census of Manufactures Data by Industry

Results of the Census of Manufactures are published industry by industry as they become available. Although statistics for the 1970 Census were appearing as this Chapter was being prepared (January 1972), the Census of 1969 was the latest for which all industries had been issued. Table 5 shows summary statistics for 1961-69 and Tables 6 and 7 show selected results of the 1969 Census for industry groups and individual industries compared with figures for 1968. To help visualize some of the changes that took place in individual manufacturing industries in 1969, Table 8 shows the largest increases or decreases in numbers of employees. It should be noted that data shown for the 1969 Census are subject to revision.

### 5.—Summary Statistics of Manufactures, 1961-69

Year	MANUFACTURING ACTIVITY							
	Estab- lish- ments	Production and Related Workers			Cost of Fuel and Elec- tricity <sup>1</sup>	Cost of Materials and Supplies Used	Value of Shipments of Goods of Own Manu- facture	Value Added
		Number	Man- Hours Paid	Wages				
	No.		'000	\$'000	\$'000	\$'000	\$'000	\$'000
1961.....	33,357	939,413	1,968,163	3,532,943	516,409	12,579,798	23,438,956	10,434,832
1962.....	33,414	974,376	2,071,376	3,834,514	540,447	13,974,877	25,790,087	11,429,644

<sup>1</sup> Cannot be reported separately for manufacturing and non-manufacturing activities but related substantially to manufacturing activity.

<sup>2</sup> Includes production and related workers, administrative and office employees, sales, distribution and other employees; excludes working owners and partners.

<sup>3</sup> Includes supplies used in both manufacturing and non-manufacturing activity.

<sup>4</sup> Includes shipments of goods of own manufacture, value of shipments of goods purchased for resale and other operational revenue.

<sup>5</sup> Value of total operational revenue less total cost of materials, supplies, fuel and electricity used and goods purchased for resale in the same condition; all adjusted for inventory changes where required.

6.—Summary Statistics of Manufactures, by Industry Group, 1968 and 1969<sup>a</sup>

Industry Group and Year	Estab-lish-ments	MANUFACTURING ACTIVITY					TOTAL ACTIVITY

## 8.—Industries Showing Changes of 1,000 or More in Number of Employees, 1968 and 1969

(Ranked according to numerical increase or decrease)

Rank	Industry	Total Employees		Change 1968-69	
		1968	1969	Number	Percentage
	<b>Increases—</b>				
1	Communications equipment manufacturers.....	43,117	48,935	5,758	13.5
2	Miscellaneous machinery and equipment manufacturers..	47,813	52,585	4,772	10.0
3	Motor vehicle manufacturers.....	39,112	41,916	2,804	7.2
4	Manufacturers of electrical industrial equipment.....	22,634	25,425	2,791	12.3
5	Motor vehicle parts and accessories manufacturers.....	39,454	41,541	2,087	5.3
6	Miscellaneous vehicle manufacturers.....	3,940	5,988	2,048	52.0
7	Pulp and paper mills.....	73,498	75,427	1,929	2.6
8	Sawmills and planing mills.....	47,987	49,837	1,850	3.9
9	Truck body and trailer manufacturers.....	8,625	10,129	1,504	17.4
10	Synthetic textile mills.....	20,293	21,749	1,456	7.2
11	Manufacturers of miscellaneous electrical products.....	13,196	14,494	1,298	9.8
12	Office and store machinery manufacturers.....	12,733	14,005	1,272	10.0
13	Women's and children's clothing contractors.....	6,581	7,709	1,128	17.1
14	Plastics fabricators, <i>n.e.s.</i> .....	18,976	20,089	1,113	5.9
15	Manufacturers of household radio and television receivers	7,003	8,087	1,084	15.5
16	Railway rolling stock industry.....	5,048	6,128	1,080	21.4
17	Fabricated structural metal industry.....	17,150	18,203	1,054	6.1
	<b>Decreases—</b>				
1	Iron and steel mills.....	44,634	42,954	-1,680	-3.8
2	Smelting and refining.....	34,710	33,376	-1,334	-3.8
3	Slaughtering and meat processors.....	30,540	29,232 <sup>p</sup>	-1,308	-4.3

## Subsection 3.—Distribution of Manufacturing by Province and by Census Metropolitan Area

## Distribution by Province

Central Canada accounted for about four out of every five dollars of all value added by manufacture in the manufacturing industries of Canada in both 1968 and 1969; Ontario's contribution in 1969 was 52.8 p.c. and Quebec's was 28.2 p.c., somewhat more than half as great. British Columbia was in third place, accounting for some 8.7 p.c. of value added by manufacture. The three Prairie Provinces together were almost as large a contributor, accounting for 6.8 p.c., and the Atlantic Provinces accounted for 3.5 p.c. One way of comparing the intensity of manufacturing activity in these regions is in terms of value added per capita of their population. The 1969 Canada average was \$956. Quebec and British Columbia were both close to this average, the per capita manufacturing value added in their manufacturing industries amounting to \$948 and \$844, respectively, but Ontario's average was much higher at \$1,427. The average for the Prairie Provinces was \$393 and that for the Atlantic Provinces, \$348.

9.—Summary Statistics of Manufactures, by Province, 1968 and 1969<sup>a</sup>

NOTE.—Based on the revised standard industrial classification and new establishment and total activity concepts.

Province or Territory and Year	Estab- lish- ments	MANUFACTURING ACTIVITY						TOTAL ACTIVITY		
		Production and Related Workers			Cost of Fuel and Elec- tricity	Cost of Materials and Supplies Used	Value of Ship- ments of Goods of Own Manu- facture	Total Employees		Total Value Added
		Number	Man- Hours Paid	Wages				Number	Salaries and Wages

Distribution by Metropolitan Area

Table 11 shows the latest annual Census of Manufactures (1967 and 1968) data for 18 Census Metropolitan Areas for which information can be published. These exclude employees and activity of head offices, sales offices and auxiliary units which are included in manufacturing industry totals for Canada and the provinces given in Subsection 2.

Monthly surveys of employment afford a basis for estimates of the number of employees in the manufacturing industries in four metropolitan areas for periods later than the Census of Manufactures. The following are figures for 1969 and 1970:—

<i>Metropolitan Area</i>	<i>Employees in Manufacturing Industries</i>	
	<i>1969 Average</i>	<i>1970 Average</i>
Montreal.....	300,500	296,100

An alloy known as 9% Ni Steel has been found to be an ideal metal for the construction of cryogenic tanks now used in a wide range of chemical and industrial applications for storing large quantities of liquid oxygen, nitrogen and other gases, for which they must remain completely air-tight during their useful life.

### 11.—Summary Statistics of Manufactures, by Census Metropolitan Area, 1967 and 1968<sup>p</sup>

### Subsection 4.—Size of Manufacturing Establishments Based on Employment and Shipments

Almost one third of the manufacturing establishments in Canada have fewer than five persons employed, including any working owners. However, these establishments, because of their small average size, account for only about one seventieth of the working force of the manufacturing industries. The average size of a manufacturing establishment, in terms of persons employed, is somewhat over 50 persons but more than one half of the total work force of the manufacturing industries is in establishments employing 200 or more persons.

### Size Based on Shipments

The average size of a manufacturing establishment in terms of shipments of goods of own manufacture was \$1,288,532 in 1968, about one and three quarters times the average size in 1961. However, this average size is greatly affected by the large number of very small establishments which in fact account for only a minor share of over-all shipments. Establishments with \$1,000,000 or more shipments of goods of own manufacture in 1968

accounted for about one establishment in five, but these larger establishments were responsible for 88 p.c. of the total value of shipments of goods of own manufacture of the manufacturing industries.

**Subsection 5.—Exports of Manufactured Goods**

Export statistics are not broken down into manufactured goods and other goods but the categories "fabricated materials" and "end products" give some indication of the degree of manufacture of such exports and the total for the two can be used as a substitute for manufactured exports. Because exports are not necessarily made by the manufacturer and because of valuation problems, the resulting series are not wholly comparable with Census of Manufactures data on manufacturers' shipments of goods of own manufacture.

In the latter, for instance, work by smelters owned by mining companies is valued at an imputed charge to the mine, not at the value of the metal produced. The following figures show recent trends in exports of manufactures approximated in this way:—

Year	<i>Domestic Exports of—</i>		
	<i>Fabricated Materials</i>	<i>End Products</i>	<i>Total Manufactured Goods</i>
	\$'000,000	\$'000,000	\$'000,000
1961.....	2,916.4	706.4	3,622.9
1965.....	3,928.5	1,606.3	5,529.8
1966.....	4,217.0	2,455.1	6,672.1
1967.....	4,417.3	3,476.5	7,893.7
1968.....	5,027.9	4,702.4	9,730.4
1969.....	5,344.9	5,828.3	11,173.2
1970.....	6,083.4	6,082.8	12,166.3

An important reason for the rising level of exports in the end products category has been the Canada-United States Agreement on Automotive Products, which went into effect in 1965.

## Section 2.—Trends in the Number of Manufacturing Establishments

It is interesting and perhaps surprising to realize that the number of manufacturing establishments in Canada has not been increasing in recent years. Most types of manufacturing activity have been on the up-trend and the ordinary citizen often reads of or sees new factories being constructed, so that it is natural to assume that all this industrial growth should indicate that more manufacturing establishments\* in 1969 than in 1961, according to the annual Census of Manufactures. The situation is clearly not one of growth in the over-all number of factories, although the decline was only 2 p.c., for the reason that opposite trends in different industries almost offset each other. The net change is the result of forces acting upon the level of production and upon the average size of establishment within industries in a complex and widely varying fashion.

An examination of changes in numbers of establishments in various industries may, therefore, be of some interest. In a sense, of course, the number of establishments is one of the less important figures relating to the manufacturing industries. Because production and employment are heavily concentrated in a relatively small number of large establishments in most industries (see p. 764), changes in establishment numbers that reflect fluctuations in the number of small establishments often have little impact upon output or jobs. It is also true that technicalities involved in the methods of gathering or compiling statistics can have some effect on the number of establishments, particularly the number of very small establishments.

However, in other ways, the question of why there are more or fewer establishments in an industry has importance and special interest, if only as a symptom of other developments. A trend toward more establishments in an industry may point to opportunities for those interested in promoting the industrial growth of particular regions to attract new establishments to their areas. Likewise, rising or falling numbers of establishments in an industry often indicate increasing or more restricted opportunities for the individual seeking to own and operate his own manufacturing establishment as a small businessman.

Of wider interest, the number of establishments divided into the total employment, shipments, value added or another statistic of the industry affords a measure of the average size of establishment. Although this figure can be misleading if there has been merely a

\* An "establishment" is a statistical reporting unit approximately equivalent in practice to a factory, plant or mill.

# NUMBER OF INDUSTRIES SHOWING SPECIFIED AVERAGE ANNUAL PERCENTAGE RATE OF CHANGE IN EMPLOYEES PER ESTABLISHMENT, 1961-69

\* DATA ADJUSTED TO INCLUDE PROCESS CHEESE MANUFACTURERS,

change in the number of small establishments with no change in the representative size of large establishments which account for most of the production, changes in the simple average establishment size do often, in practice, point to trends in the economies of operating small or large establishments or to waves of "rationalization" in industries. These trends, or the possibility of their existence when so identified, can be explored in more detail by the use of other statistics.

There is no hard and fast logic to the growth of establishments in relation to growth in production. In some industries, establishments increase in years when production increases, and decrease when production decreases. In some industries characterized by large establishments with virtually no small establishments, there may be a tendency for the opening of new establishments to precede the growth of production. In still other industries, there may be a tendency for an increase in production in the year before—at least if sustained in the current year—to influence some small operators to enter the industry.

It is noticeable that, even in industries where the number of establishments is falling, the fall may be slowed down in years of expanding production. An example of this is the dairy factories. In the chart on p. 769 showing net changes in the number of dairy factories for the 1962-69 period in comparison with changes in the industry's index of real domestic product, it will be seen that although rationalization has been drastically reducing the number of plants, the shrinkage is less when production is higher.

By way of partial explanation of the effect of methods of gathering and compiling statistics, it is noted that in 1963 Statistics Canada began identifying new establishments with the help of the Unemployment Insurance Commission and continued to do so for the remainder of the period under discussion here (1961-69). There was an unusually large increase in establishment numbers in 1964 in many industries; more industries had a higher percentage change of establishment numbers in that year than in any other year of the 1961-69 period. However, establishment numbers tend to increase in years of increasing production and 1964 was also a year of high rate of increase in output. It is therefore difficult to determine to what extent the method of identifying new establishments affected the count, but it appears to have done so.

The Central Registers staff of Statistics Canada publishes a semi-annual report entitled *New Manufacturing Establishments in Canada* (Catalogue No. 31-002), which lists and gives counts of establishments entering or intending to enter manufacturing. These numbers of new establishments are not actually "births" for Census purposes since many never actually get into production. But, by certain indirect manipulations of these data and net changes in Census establishment numbers, it would be possible to make indirect estimates of "births" and "deaths" of manufacturing establishments in the manufacturing industries as a whole; however, it is the intention to move toward the issuance of actual birth and death statistics for the Census of Manufactures rather than calculate indirect approximations of this kind.

The net change in Census establishment numbers is the difference between births and deaths of establishments, after allowance for technicalities like reclassification of establishments that have changed their predominant activity and a minor amount of splitting or combining of reporting units for accounting reasons. In individual industries, it should be noted, the reclassification of establishments that have changed their product specialization sometimes has a significant impact on establishment numbers.

### Change Trends in Industry Groups

To quite an extent, the net decline in the over-all number of establishments is the result of special situations in two industry groups—the wood industries and the food and beverage industries. Of the 20 industry groups that make up the manufacturing division of the Standard Industrial Classification, only these two showed a decline of more than 40 establishments between 1961 and 1969.

Both, however, showed truly dramatic changes. In the wood industries, the number of establishments dropped by 1,740 or by approximately one third. In the food and beverage industries, the corresponding decrease was 1,652 establishments, or about one fifth.\*

If these two groups were left out of account, the remaining 18 would actually show a net increase of 2,704 establishments between 1961 and 1969, or 13.3 p.c. So it might perhaps be said that, except for two special cases, the number of manufacturing establishments increased from 1961 to 1969. However, even within the other industry groups there was a considerable variation from the small decreases of some groups through the moderate increases in others to very large increases in a few groups. In the machinery industries, the number of establishments increased by about one half over the period. In three groups—the electrical products industries, the metal fabricating industries and the transportation equipment industries—the increase was slightly more than one third.

Table 19 shows the establishment numbers in 1961 and 1969 in each of the 20 groups, ranked according to size of numerical change. The individual industry, or industries, making the largest contribution to the net change is noted where this seems worthy of mention.

Because the rate at which production is expanding or declining in an industry can have an effect on the number of establishments, Table 20 compares the average annual rate of change of establishment numbers, production and employees per establishment. The groups are ranked by the average annual rate of change of establishments, divided by the production index. (Production is measured by the index of real domestic product originating in an industry; this is an indicator of the level of net output, adjusted to remove the effect of price changes, in relation to a base period—1961.) Average annual rates of change in this Section are trend rates obtained by the method of least squares of logarithms, since comparing only the first and last year may reflect an undue influence from these particular years, especially in the case of production or employees. The employees include those working in separate head offices, sales offices and auxiliary units as well as in establishments, but the distortion in calculating average establishment size in this way is probably not appreciable.

The intention in dividing establishments by the production index is to show whether establishment numbers are rising or falling in relation to the level of production. Dividing the production index by the number of establishments and measuring the growth of this statistic would be possible but misleading; some might be tempted to interpret it as “productivity” per establishment, since it is usual to divide production indexes by employment to measure productivity per person employed. While the employment of more or less labour, together with other factors of production, directly results in the change in output, the change in the number of establishments, so often involving very small establishments, is more associated with changes in production than a direct cause of it. However, it will be seen from Table 20 that employees per establishment have been growing most rapidly in those industry groups where establishments have been falling most rapidly in relation to production. The relationship is not perfect, of course, because rates of change of labour productivity have varied; the examination of productivity changes, however, is not undertaken here.

It will also be seen that, except for apparent special cases at the top and bottom ends of the ranking, the rates of change of establishments divided by production show a marked “bunching” together. In four of the industry groups, establishments have declined in relation to output at the same average annual rate of 4.8 p.c. and the figures for a number of others are not greatly different.

Two of the four industry groups at the top of Table 20 are the same two responsible for the net decline in the over-all number of establishments—the wood industries and the food and beverage industries. They, in turn, reflect the particularly rapid “shakeout” of

\* Establishment numbers used in this Section represent minor revisions of the preliminary data used in the first Section of this Chapter.

small establishments in three industries—sawmills and planing mills, dairy factories, and bakeries. In the case of the transportation equipment industries, the main reason for the drop in establishment numbers in relation to production is the unusually high rate of expansion in production. This is chiefly a result of the Canada-United States Agreement on Automotive Products which came into effect in 1965 (see Chapter XXI). Although this agreement did lead to new establishments being set up, its most pronounced effect was the increase in the size of production runs in the industries associated with motor vehicle production.

A rapid rate of growth of production has enabled the chemical and chemical products industries, which rank fifth among industry groups in production, to gain fourth place in terms of the rate at which establishment numbers have been declining in relation to production. This, like the transportation equipment industries, is an industry sector where short production runs have traditionally been a problem.

The miscellaneous manufacturing industries reflect particularly rapid expansion of output in one industry and thus the effect of the changing "mix" of industries within the group—as do the industry groups generally. Plastics fabricators, the source of the greatest production growth, is characterized by much larger production units than, for example, dental laboratories.

The leather industries, at the other end of the table and of the ranking, also represent a special case. Production has been almost unchanged on a trend basis, declining at an average annual rate of 0.8 p.c.; the rate of change in total number of establishments was identical, —0.8 p.c. The result was virtually no change in establishments in relation to production; interestingly, there was also virtually no change in the number of employees per establishment. It should be noted, however, that there were diverse movements among the industries in the group.

Of course, all the industry groups may be considered to be special cases, in that special factors influence the rate of growth or decline of the establishments in them. In the machinery industries, for instance, there is a rough relationship between year-to-year changes in gross fixed capital formation in the form of machinery and equipment, after removal of the effect of price changes, and the net change in the number of establishments in the industry group.

### Industries with More Establishments

An examination of the individual industries that have shown particularly large or small relative changes in establishment numbers will point up more specifically the sort of forces influencing the number of establishments.

Table 18 shows the 20 industries with the largest percentage increase in establishment numbers between 1961 and 1969. Four industries more than doubled the number of their establishments; in each, the main reason was the rapid growth of demand for the industry's product. The largest percentage increase in establishments still leaves *Miscellaneous vehicle manufacturers* with a small number of establishments. However, the industry's index of real domestic product for 1969 was 1,589.3; since the index is based on 1961 equalling 100, output was up almost sixteenfold. In fact, the make-up of the industry changed completely during the period because of the rise to popularity of the snowmobile.

In addition to this enormous effect of the recreational vehicle on the output of this industry, other recreational vehicles have had an impact on establishment numbers both in this industry and the second ranking industry in Table 18. "All terrain" vehicles in the form of off-road rubber-tired vehicles and hovercraft have led to new plants in the miscellaneous vehicle manufacturers industry; such products as mobile homes, travel trailers, tent trailers, camper bodies for trucks and boat trailers helped increase establishment numbers in the second-ranking industry—*Truck body and trailer manufacturers*. A trend in the method of serving a market has influenced the third industry—*Explosives*

That's a  
66 Chevy  
not a Vega

Vega production at the General Motors of Canada plant at Ste Thérèse, north of Montreal, utilizes many new assembly-line techniques; at the "body drop" portion of the line, the car body is joined to the chassis. Output for the 1973 model year is 50 cars an hour.

and ammunition manufacturers. To an increasing degree, it has been supplying the mining industry from "mobile" explosives plants, contributing heavily to the increase in establishment numbers.

*Carpel, mat and rug manufacturers* represent the effect of expanded demand for the industry's products, changing buyer preferences combining with an expanded market for floor coverings (one new establishment resulted from a radically new product—indoor-outdoor carpeting). The industry ranks second in average rate of total output.

By way of explanation of the experience of some of the other leading percentage-gainers of establishments, as shown in Table 18, the following comments are made.

*Ready-mix concrete manufacturers*—Although this industry was in fifth place in relative gain in establishment numbers and had a high rate of growth of total output, its establishments increased at almost the same rate as output in terms of average annual rate of change. The ease of entry into this industry on a small scale, where one ready-mix truck may suffice, is a factor.

*Agricultural implement industry*—Although production in this industry is heavily concentrated in large establishments of multi-line companies, the number of establishments has grown at almost the same trend rate as production because of the entry of small, single-line companies producing specialty equipment.

*Plastics fabricators, n.e.s.*—The impact on establishment numbers is from growth of the industry's output; it ranks fifth in terms of average annual rate of increase of real domestic product for the 1961-69 period.

*Fabricated structural metal industry*—Highly decentralized to serve its local markets, establishments in this industry have grown because of increased production and at almost the same rate.

*Manufacturers of mixed fertilizers*—A decentralization of activity in this industry has taken place, with increased use of fertilizer "blending plants" which mix basic fertilizer materials to meet the individual user's needs.

*Communication equipment manufacturers*—Both establishment and production growth reflect the rapid expansion of that nebulous (but unofficial) industrial category, the "electronics industry". Among other product innovations, demand for "hardware" of various types for computer users has led to new establishments. Branch plants have also played a role in establishment proliferation; one company owned three establishments in 1962 and 14 in 1969.

*Manufacturers of electrical industrial equipment*—This industry makes generators, among other items, and has benefited from the growth of electrical utilities. Reorganization in large companies with establishment of branch plants has played an important role; two large firms owned eight establishments in 1962 and 50 in 1969.

*Hardware, tool and cutlery industry*—Although builders' hardware manufacturers have increased little in number over the 1961-69 period, many more tool and die shops have come into existence.

*Synthetic textile mills*—This industry reflects not only the growth of production but reclassification of establishments for statistical purposes, a consideration affecting a number of industries. Cotton yarn and cloth mills now producing synthetics have been "moved" from one industry to another, representing not new plants but a change in product specialization.

*Aluminum rolling, casting and extruding*—Here again, changes in market preferences and product innovation have had an impact on establishment numbers. The growth of mobile home production, noted above, has stimulated the production of shapes in this industry, as has the use of aluminum siding for houses and aluminum uses in high-rise buildings.

*Miscellaneous machinery and equipment manufacturers*—This industry, the largest of the machinery industries in output as well as establishments, has grown with the economy and the level of capital investment.

*Distilleries*—Geographical diversification of production has played an important role in increasing establishment numbers in this industry.

*Machine shops and miscellaneous metal fabricating industries*—Each of the industries in this group has grown in both establishments and production in response to the growth of the other industries that they serve. Survey methods may have had some impact on changes in machine shop numbers.

*Motor vehicle parts and accessories manufacturers*—The large gap between the growth rate of production and that of establishment numbers indicates a much larger average size of establishment. This is a natural consequence of those producers who have obtained orders as a result of the Canada-United States Agreement on Automotive Products achieving the longer production runs they have long needed.

*Cordage and twine industry*—This small industry is unusual in having more establishments in the face of a downtrend in production. The impact of import competition on one of its important products has apparently not affected opportunities for some other new, smaller establishments.

### Industries with Fewer Establishments

Of the 54 industries that had fewer establishments in 1969 than in 1961, the 10 with the largest percentage decreases are shown in Table 18. Again, the apparent reasons for their loss of establishments are illustrative of the factors lying behind similar changes in other industries. The "loss" of establishments may, of course, be a "gain" in another sense where this reflects a higher average size of operation with consequent economies for customers and producers. Some of the losses of establishments reflect such rationalization as a result of technological advance, of competition from domestic producers or from competitors in other countries. In other cases, the loss reflects a declining state in the industry from a lower over-all demand for the product or from adjustment of external competitive pressures.

In two industries with really large numerical declines in establishments—1,535 in *Sawmills and planing mills* and 762 in *Dairy factories*—the source of the declines has been rationalization and technological change. A variety of forces have been acting to eliminate small dairy factories. In addition to uneconomic plants simply going out of business, there have been numerous acquisitions of obsolescent plants by private firms or co-operatives. Milk-receiving stations in rural areas coming into wider use meant that some small companies did not have the capital for these necessary modernizations. Cheese factories also declined over this period. (In the data used here, another industry—process cheese manufacturers—has also been included.) Cost pressures, the demand of modernization and more rational use of forest resources have all combined to sharply reduce the number of small sawmills. (There has been a minor impact, which does not affect the quality of the data, from methods of gathering statistics.)

Although not included on the list of largest percentage changes of establishments, the drop of 570 in bakeries establishments merits comment. Competitive pressures and concentration of retailing have proved disadvantageous to many middle-size or small bakeries and improved highways have perhaps tended to centralize production geographically. During the enumeration for the Census of Merchandising, many small units are identified

The heart of a new modern dairy where pasteurizing, homogenizing and separation into 2-p.c. and whole milk takes place. The production of dairy products is rapidly being concentrated into fewer and larger plants.

(at 10-year intervals), which are primarily manufacturing in nature; consequently, these are added to the Census of Manufactures. An influence in the opposite direction is the tendency of many extremely small bakeries to be identified between Censuses of Merchandising (or during that enumeration) as being essentially restaurants or stores which do some baking of their own. Their small dollar volume means that fluctuations in establishment numbers from these causes have very little effect on the over-all quality of the data.

*Venetian blind manufacturers* had the largest percentage decrease in establishments, although this was always a small industry. This represents the reverse situation to that of some of the industries gaining establishments the most rapidly. Changes in product preferences have reduced demand for the industry's output and establishments have declined at almost the same rate as output.

*Poultry processors* have fewer establishments than in 1961 despite substantial gain in output. Rationalization of production has been under way, a special form of this involving the closing of "defeathering" plants serving central units in a satellite capacity.

Comments on some of the other industries in the table are:

*Stone products manufacturers*—A trend away from the use of stone monuments in cemeteries and to the use of other materials in large buildings has reduced establishments slightly more rapidly than output.

*Hosiery mills*—Rationalization of production is reflected in a one-third decline in establishments.

*Manufacturers of major appliances (electric and non-electric)*—Although the production gain reflects the rise in residential construction and living standards, this industry, with considerable over-capacity and import competition, has experienced a decline in number of establishments, effecting a form of rationalization.

*Hat and cap industry*—Just as consumer preferences have benefited some industries gaining establishments, they have decreased per capita demand for hats; establishments have declined at almost the same rate as output.

Colour TV sets nearing the end of the assembly line in a large Canadian manufacturing plant.

<sup>1</sup> Establishments divided by index of real domestic product for industry group (1961=100).

## Section 3.—Government Assistance to Manufacturing

### Subsection 1.—Federal Assistance to Manufacturing\*

The Department of Industry, Trade and Commerce (a merger of the former Departments of Industry and of Trade and Commerce Apr. 1, 1969) has responsibility for stimulating the establishment, growth and efficiency of the manufacturing, processing and tourist industries in Canada, and also for the development of export trade and external trade policies. It assists Canadian industries to initiate and take advantage of technological advances, improve products and services, increase productivity and expand domestic and foreign markets. To achieve these goals, a wide variety of programs and services are offered. At each phase of the product cycle—from research, development and design through production and marketing—the Department can assist with information and financial assistance.

**Program for the Advancement of Industrial Technology (PAIT).**—The objective of PAIT is to promote the growth and efficiency of industry in Canada by providing financial assistance for selected projects concerned with the development of new or improved products and processes incorporating advanced technology, which offer good prospects for commercial exploitation in domestic and international markets. The program, initiated in 1965, was revised in 1970 to provide cash grants in lieu of loans, and has been expanded to include assistance for some specific activities outside of the development phase.

Financial assistance, normally 50 p.c. of the development costs and certain eligible preproduction and marketing expenses, is available to companies incorporated in Canada for projects to be carried out in Canada. Title to any invention or patent is vested in and remains the property of the company. Companies are expected to have the capabilities and facilities to undertake the development work and also to provide for the manufacture and sale of the resulting products. The program is designed to increase the technical competitiveness of Canadian industry and is also intended to help create an industrial environment attractive to Canada's best-qualified scientific, technical and managerial personnel.

To Mar. 31, 1971, the Government had made commitments to provide assistance to the extent of \$90,000,000 for 368 projects having an estimated value of \$178,000,000.

**Industrial Research and Development Incentives Act.**—This legislation, enacted in March 1967 and administered by the Department of Industry, Trade and Commerce, provides cash grants or equivalent tax credits equal to 25 p.c. of capital expenditures of corporations for scientific research and development conducted in Canada, and for the increase in current expenditures in Canada for scientific research and development over the average of such expenditures in the preceding five years. To qualify for a grant, expenditures must be for scientific research and development which, if successful, is likely to lead to or facilitate an extension of the business of the corporation. In addition, a corporation must undertake to exploit the results of the research and development in Canada and must normally be free to export products resulting from such research and development to all countries of the world.

**Automotive Program.**—The Canada-United States Agreement on Automotive Products signed by the Prime Minister of Canada and the President of the United States on Jan. 16, 1965, provides for the removal of tariffs and other impediments to trade between the two countries in motor vehicles and original equipment parts. The basic objectives of the Agreement are: creation of a broader market to permit benefits of specialization and

\* Prepared in the Promotion Branch, Canadian Division, Department of Industry, Trade and Commerce, Ottawa.

scale; trade liberalization to enable both countries to participate in the North American market on a fair and equitable basis; and development of conditions in which market forces would operate to attain economic patterns of investment, production and trade. (See also Chapter XXI.)

As a result of this program, Canada is now producing an increasingly larger share of the total North American output of vehicles and components. Canadian exports of vehicles and parts and employment in this industry have increased substantially, and additional investment in new plants and expansion to existing facilities have been extensive. Although all of the objectives have not yet been fully realized, the Agreement is working well.

**Machinery Program.**—A machinery program was introduced on Jan. 1, 1968, with the objective of increasing efficiency in Canadian industry by enabling machinery users to acquire advanced capital equipment at the lowest possible cost while affording Canadian machinery producers tariff protection on what they manufacture. At the same time,

*Testing a \$20,000,000 PAIT-and-company-funded project. This submersible service capsule containing a life-support system for oil production crews working on the ocean floor is headed for a \$7,000,000,000 market.*

Canadian machinery producers are protected by a single statutory rate of duty which applies immediately when they are in a position to supply. This is particularly significant for Canadian producers of custom-engineered machinery.

The program covers a broad range of machines classifiable under Tariff Item 42700-1 including general-purpose machinery, metalworking and woodworking machinery, construction and materials handling equipment and various types of special industry machinery, such as pulp and paper and plastics industry machinery, and service industry equipment. The statutory rate of duty under that Tariff Item is  $2\frac{1}{2}$  p.c. British preferential and 15 p.c. most-favoured-nation.

The program provides that the duty otherwise payable on machines, accessories, attachments, control equipment, tools and components, imported under Tariff Item 42700-1, may be remitted if such remission is in the public interest and the goods imported are not available from production in Canada. A Machinery and Equipment Advisory Board advises the Minister of Industry, Trade and Commerce regarding the eligibility of machinery for remission of duty in accordance with the provisions of the Tariff Item. The Board, in turn, is assisted by the Branches of the Department concerned with individual industries, including machinery manufacturing. Final authority for granting remission lies with the Governor in Council.

Under the program, machinery producers may also apply for remission of duty on production parts and components included in Tariff Item 42700-1 which they cannot procure in Canada. This provision is for the purpose of stimulating Canadian machinery manufacturers to specialize their production and enable them to compete more effectively.

In the budget of June 18, 1971, the provisions of the Machinery Program were extended to importations under Tariff Item 41100-1 covering machinery for use in sawmills and logging. Also in 1971, the Machinery and Equipment Advisory Board was given the responsibility to examine all tariff remission applications in respect of machinery and equipment or production tooling for the manufacture of original equipment, automotive parts and accessories; this was previously the responsibility of the Adjustment Assistance Board.

**Building Equipment, Accessories and Materials Program (BEAM).**—The BEAM program was established to assist in achieving greater efficiency and productivity in the manufacture and use of building equipment accessories and materials, thereby realizing economic gains from the industry's domestic and foreign activities. The objectives of the program include: establishment of a comprehensive National Construction Information System; encouragement of modular dimensional standardization and co-ordination; acceleration of the industrialization of the building process; development and expansion of export markets; promotion of uniform building regulations and standards; and encouragement of building design excellence through awards programs.

The program is being implemented and is subject to further development through the Construction Industry Development Council and in co-operation with industry through the major associations. The Council, which is responsible to the Minister of Industry, Trade and Commerce, is national in scope, comprised of 35 representatives of the manufacturing, design and contracting sectors of the industry as well as labour unions, universities and government. It provides a forum for industry-government dialogue on matters of economic and technological importance to the construction industry and a means of assisting the industry to become a modern integrated industry with a high potential for competing in export markets. Co-operating directly in the BEAM program are the Canadian Construction Association, the Royal Architectural Institute of Canada, the Association of Consulting Engineers of Canada, the Specification Writers Association, the National Home Builders Association, and the Housing and Urban Development Association of Canada.

Having established the needs and priorities for construction information in Canada, ways in which a comprehensive and flexible information system can be developed were

identified. A *Thesaurus of Canadian Construction Industry* terms has been compiled in both English and French to assist in providing a means of indexing to the System and to resolve the ambiguity in construction terminology.

The design and performance specifications for a National Construction Information System have been completed and work has commenced on the acquisition of data suitable to the System. To provide a commercial vehicle for operating this System a non-profit corporation known as the Canadian Construction Information Corporation has been chartered.

The Department has continued the program to encourage the increased use of dimensional standardization and co-ordination of building components and buildings. Initially, conferences were held throughout Canada to acquaint policy-makers within the industry with the technological and economic advantages of modular standardization. These conferences continue to be followed up by a program of Clinics of Modular Practice. In addition, a *Directory of Modular Building Components* is published annually.

Encouragement of greater industrialization of the building process through an understanding and application of a systems approach to building is being carried out through publications and through conferences and seminars held across Canada.

To encourage building design excellence, awards for the creative use of materials in architecture and structural engineering have been presented under the Design Awards Program. This program is sponsored by the National Design Council and the Department of Industry, Trade and Commerce in co-operation with the Portland Cement Association within the framework of the BEAM program.

The promotion of universal use of the National Building Code is continuing. Manitoba has made it mandatory for all larger cities and towns. Ontario, New Brunswick, Nova Scotia and British Columbia have taken or are planning to take similar action and Quebec is studying its feasibility. An index of all codes, standards and specifications used in the Canadian construction industry has been compiled and is available as an information document entitled *Building Standards Index*.

Export opportunities for the goods and services of the construction industry continue to be identified through the Department's trade posts abroad and in co-operation with industry.

**Industrial Design.**—The design program, under authority of the National Design Council Act, administered by the Department of Industry, Trade and Commerce, implements programs to promote and expedite improvement in the products of Canadian industry. The Department is also responsible for developing and carrying out programs and projects that may be appropriate to the utilization of improved industrial design.

Current design programs include: financial and technical assistance to co-operating educational institutes for the purpose of introducing design training at the technical and university levels; seminars on various facets of design for the benefit of the professions, educators, business executives and the general public; awards programs for achievements over a broad field of design endeavour; the awarding of scholarships for advanced training in industrial design in Canada and abroad; the awarding of grants for design research and design promotion in Canada; and the provision of technical and financial assistance to committees and groups dedicated to the implementation of programs to foster good design on a national, regional or industry basis.

Extensive studies conducted in 1969 into the state of design in Canada revealed that the focus of attention should be directed to the manufacturing sector. As a result, the operation of the Design Canada Centres ceased on Mar. 31, 1970, and a program of industrial design assistance was introduced in 1970-71, under which financial support is given to the manufacturing industries that demonstrate their interest in developing new and improved designs by employing qualified industrial design services. Such assistance is available to companies incorporated in Canada, to groups of companies organized as consortia, and to trade associations that can satisfy program requirements; it is concentrated

on relatively short-term projects of product innovation and is limited to 50 p.c. of the industrial design operational and administrative costs, subject to the technical and commercial feasibility of the project.

In recognition of the outstanding contribution of Canadian business management toward the cause of good design, a National Design Council Chairman's Award for Design Management was introduced in 1970, to be presented to the management which, in the Council's opinion, does the most to integrate and efficiently apply good corporate design policy. This Award is conceived in the broadest terms of a total design management context—from the premises to the packaging.

**Defence Industry Productivity Program.**—This program (combining the former Industry Modernization for Defence Exports Program and the Defence Development Sharing Program) is designed to enhance the technological competence of Canadian defence industry in its export activities by providing financial assistance to industrial firms for selected projects. Emphasis is placed on those areas of defence technology having civil export sales potential. Assistance may cover the development of products for export purposes; the acquisition of modern machine tools and other advanced manufacturing equipment to meet exacting military standards; and assistance with preproduction expenses to establish manufacturing sources in Canada for export markets.

Projects initiated under this Program have greatly assisted industry in developing skills on a specialized basis in fields of technology that have defence and civil applications, which Canada is favourably situated to exploit. Costs of these projects are shared by the Department and the Canadian firm concerned and, in some instances, by the governments of other NATO countries. Manufacturing equipment projects are selected for assistance on the basis that the machinery acquired will make a significant contribution to increased productivity. Generally, this means that the machinery is the most advanced of its type, such as numerically controlled metalworking equipment.

**Automotive Adjustment Assistance Program.**—This program, which remains in force until June 30, 1973, offers opportunities to Canadian automotive parts manufacturers for expanded production, rationalization of output and reduced costs. In order to take advantage of these opportunities, Canadian parts makers must engage in substantial re-equipment and plant expansion programs. Term loans are made available for the financing of the acquisition, construction, installation and modernization of facilities or machinery and for use as working capital. Tariff remission was transferred to the Machinery and Equipment Advisory Board, effective June 1, 1971.

**General Adjustment Assistance Program (GAAP).**—This Program, established in 1968 and revised in 1971, helps manufacturers take advantage of export opportunities arising from the Kennedy Round and assists manufacturers of textile or clothing goods or footwear to improve their competitive position in domestic or export markets. The Program also provides assistance to manufacturers who have been injured, or are threatened with serious injury, as a result of Kennedy Round reductions of Canadian tariffs, and to manufacturers of textile or clothing goods or footwear who require financing to adapt efficiently to disruptive import competition which is threatening, or causing, serious injury. Assistance under the program is also available to firms that provide marketing, financing or other services essential to the operations of manufacturers described above.

The governing Regulations require that eligible firms for whom loan insurance or direct loans are approved be unable to acquire the financing provided by the Board or through the Board's support from conventional sources on reasonable terms and conditions.

Assistance is available in three forms: government insurance against the risk of loss on loans made by private lenders for the purpose of financing viable restructuring projects; direct government loans to eligible applicants in special cases; and grants covering up to 50 p.c. of cost to manufacturers who require outside consulting assistance to develop restructuring proposals.

The program is administered by a General Adjustment Board on which both private industry and government are represented.

**Ship Construction Subsidy Regulations.**—Since 1967, the Department of Industry, Trade and Commerce has been responsible for shipbuilding matters, including the Ship Construction Subsidy Regulations and certain sections of the Income Tax Act and Regulations. The industry continues to respond to the policy of national competition for government shipbuilding requirements and has made active use of the subsidy program for commercial vessels. The latter provided a subsidy rate of 25 p.c. for ships other than fishing vessels for the period 1966-69, after which time it is being reduced by one half of 1 p.c. each quarter until a rate of 17 p.c. is reached in 1973. For fishing vessels, the subsidy rate is 35 p.c. With the support of other programs, the Department has encouraged the development of production of marine components and exports in this area have been increased. Also, assistance has been given to several shipyards to encourage modernization of shipbuilding facilities.

**Shipbuilding Temporary Assistance Program (STAP).**—Because the demand for Canadian-flag ships has been in a temporary decline and assistance under the Ship Construction Subsidy Regulations is not applicable to foreign-flag vessels, the Shipbuilding Temporary Assistance Program was announced in November 1970 to enable Canadian shipyards to maintain their employment levels by building for the world market. Under STAP, shipbuilding grants at 17 p.c. of approved cost (14 p.c. for very large vessels) are paid to shipyards building for registration in countries other than Canada. Some \$110,000,000 of shipbuilding contracts have been obtained (up to December 1971) by Canadian yards with the assistance of this program.

**Pharmaceutical Industry Development Assistance (PIDA).**—This program was authorized by Parliament in March 1968, and is administered by the Pharmaceutical Industry Development Advisory Committee of the Department of Industry, Trade and Commerce. Through PIDA, the Department encourages development of a more efficient pharmaceutical industry in today's competitive environment as a means of accomplishing both a greater economic contribution by the industry and better price levels for its products as they reach the consumer. By means of financial assistance, firms are encouraged to form corporate units able to employ competent management and other personnel, perform suitable research and development and undertake effective marketing programs. It enables generic drug manufacturers to improve their ability to manufacture and market lower-priced prescription drugs at more competitive prices by reorganization of their manufacturing and marketing systems. The program is particularly helpful to smaller drug manufacturers.

Under PIDA, proposals may be made to merge or annex a number of existing activities in order to increase productivity. Such plans might include mergers or joint activities in any or all of the areas of research and development, purchasing, manufacturing, distribution and marketing. Direct loans at commercial interest rates are available to provide the capital necessary for implementation of approved pharmaceutical industry development proposals.

**Program to Enhance Productivity (PEP).**—This Program is designed to induce improved productivity in manufacturing and processing industries in Canada by means of contributions to encourage companies to undertake intensive studies of significant and imaginative efficiency-improvement projects.

PEP offers a grant of a specified amount up to a maximum of \$50,000 to support up to 50 p.c. of the approved costs of a feasibility study. Repayment is not required.

The Program is intended to foster the conduct of studies that have the potential to lead to high productivity improvement projects but which, without support, likely would not be undertaken. Such a project would have been developed to the stage where the

possibility of a new approach being achievable appears reasonable but the information base is inadequate for purposes of decision-taking and the cost of obtaining such information is such that the company, without assistance, will not proceed with the project. Conversely, it is intended that the Program not assist in the conduct of studies that would likely have been carried out in any event. PEP is also designed to spark innovation as it applies to the production phase of manufacturing and processing and not as it applies to the product or process research and development phases.

If the feasibility study requires that a market analysis be conducted, the cost of the market analysis portion would not normally be expected to exceed 25 p.c. of the total cost of the study.

**Incentive for Participation in Capital Projects Abroad.**—The objective of this program is to increase Canadian participation in foreign capital projects by sharing with companies expenses incurred when competing during the pre-contractual phases of selected projects. The term "capital projects" is intended to describe facilities, systems and other complexes whose construction entails the provision of skilled services, engineering products and other capital goods. The expenses eligible for sharing with the Department will be those incurred in the pre-contractual phases of actual or potential projects and normally will fall into the categories of exploratory studies and preparation of initial proposals and bids.

The Department's contribution normally will be 50 p.c. of the costs incurred on defined work. If a company that has received assistance is successful in obtaining the business sought, repayment of the Department's contribution will be required. Repayment is not required where a company is not successful in obtaining a contract.

### **Subsection 2.—Provincial Assistance to Manufacturing\***

Assistance given by the respective provincial governments to manufacturing within their own territories is outlined in the following paragraphs.

**Newfoundland.**—The Newfoundland Government offers the following forms of assistance to prospective manufacturing firms:

- (1) The government offers advice and assistance to prospective industry in determining desirable plant location in the province and in the preparation of feasibility studies. Information can be made available on the source and availability of raw materials, transportation costs, labour costs and a variety of other economic data. The government will transport industrialists anywhere in the province so that they may obtain a first-hand look at potential plant sites.
- (2) Financial assistance may be provided by the government directly or through its Crown corporation, the Newfoundland Industrial Development Corporation and may take the form of loans against the securities offered by the prospective enterprise, or the acquisition and holding of shares or other securities of any company wherever incorporated, with the right of the enterprise to buy back these shares.
- (3) Buildings, where they exist, and land may be provided on very attractive terms.
- (4) Based on cost-benefit analyses, the government might be willing to subsidize the cost of electric power.
- (5) In two special areas within the province (Stephenville and Bell Island) the Newfoundland Government is prepared, for a period of two years after production commences, to exempt prospective firms from the province's share of the corporation income tax.
- (6) In special instances and in two special areas (Stephenville and Bell Island), the Newfoundland Government is prepared to exempt prospective firms from the provincial sales tax on original machinery, equipment and material used for plant construction or expansion.
- (7) Development operators may be exempted from paying the provincial tax on diesel oil and gasoline used in manufacturing or processing operations.
- (8) Industrial training facilities are available throughout the province for specialized courses to meet the requirements of incoming industry.

\* Prepared by the provincial authorities concerned.

**Prince Edward Island.**—Provincial assistance to manufacturing is generally funnelled through Industrial Enterprises Incorporated (IEI), a Crown corporation of the Prince Edward Island Government. It is prepared to offer assistance to prospective Island industries by way of long-term financing at attractive rates of interest. In addition, IEI assists industries by acting as a clearing house for information regarding alternate sources of credit in financing through other lending institutions or outright grants that may be available from government sources. IEI is also equipped to provide research and management services to existing Island industries or to groups contemplating new projects on the Island.

The Act incorporating IEI is particularly flexible in the terms of reference describing the manner in which IEI may participate financially in assisting industry in the province. Participation is generally by way of a first mortgage on facilities but could well be in the form of an equity position. The ratio of IEI's participation to that contributed by the investors has been very generous in the past and, necessarily, will be negotiated on an individual project basis in the future.

**Nova Scotia.**—The Province of Nova Scotia offers two programs of direct financial assistance to new or expanding manufacturers.

(1) *Industrial Estates Limited (IEL)*, a Crown corporation of the province formed in 1957, will finance 100 p.c. of the cost of land and buildings and at least 60 p.c. of the installed cost of machinery and equipment of new or expanding Nova Scotia manufacturers. The terms and conditions of financing made with clients are negotiable. IEL has made special arrangements with most Nova Scotia municipalities whereby the local taxes paid by its clients are limited to 1 p.c. of the building cost for a period of 10 years.

Additionally, IEL's Small Business Financing Division will assist manufacturing or processing industries with annual sales under \$750,000 through loans, loan guarantees and minority equity positions.

(2) The *Nova Scotia Resources Development Board*, affiliated with the Department of Development, is an amalgamation of previous loan boards including the Industrial Loan Board, the Farm Loan Board, the Fisherman's Loan Board and the Timber Loan Board. The new Board will provide financing for tourism facilities, farms and primary agriculture processing, fish plants and vessels, saw and planing mills, and timberland.

Special municipal tax assistance which is authorized under the Nova Scotia Bonus Act may provide assistance to new or expanding firms by limiting the assessment or by limiting the tax rate for a specified period of time.

It should be mentioned, in addition, that the Cape Breton Development Corporation, a federal Crown agency, is responsible for fostering greater economic activity in the Cape Breton area of Nova Scotia through the promotion of industries. The program is very flexible and the actual amount of financial assistance that will be provided to any one company or group will depend upon the over-all merits of the individual case. (See Index.)

**New Brunswick.**—The New Brunswick Department of Economic Growth has the key function of planning, directing and co-ordinating the broad strategy of economic and industrial development activities in the province. This, to a large extent, involves the provision of assistance to encourage existing industry to expand and new industry to establish. In order to carry out this function, the Department consists of three operating Branches.

(1) *The Industrial Finance Board* guarantees the repayment of loans by persons, associations or corporations engaged in industry. Applications are accepted from manufacturers only and the assistance takes the form of a guarantee of a bank loan or bond issue. Loans are to be secured by a first charge on real property, machinery and equipment.

(2) *The Industrial Services Branch* provides support services to industry through two Divisions: the Marketing Services Division complements the work of the federal Department of Industry, Trade and Commerce with a substantial external trade promotion pro-

gram, including trade fairs and missions, licensing arrangements and assistance in documentation and provides local industry with export opportunities; the Engineering Services Division has the prime responsibility for implementing the government's program of maximizing New Brunswick product content in public construction and the provision of industrial engineering assistance, production control and other engineering services.

(3) *The Development Co-ordination Branch* is responsible for co-ordinating the development efforts of the various provincial departments and agencies. It also acts as the provincial liaison unit with the federal Department of Regional Economic Expansion.

In addition, the New Brunswick Development Corporation, a Crown agency, was established to develop existing and introduce new industry to the province. It is empowered to make loans or guarantees of loans, security being usually taken in the form of a first mortgage. The Corporation must be satisfied that the funds required could not be obtained from conventional sources on reasonable terms and conditions.

A Project Branch undertakes feasibility studies required by industrial principals wishing to establish manufacturing facilities within the province. It investigates, for example, markets, resources, labour, transport, plant location, economic viability, etc., as required. An Engineering Branch advises on all engineering aspects for any new developments and expansion proposals. It has also developed and administers three industrial parks, each of which is set up as a separate company.

Another agency directed toward the economic development of the province is the New Brunswick Research and Productivity Council (see p. 470). The Council is an industrial research and development consulting organization and the source of technical information on processes, machinery, plant, etc., and of industrial engineering advice and assistance to local industry. A wide selection of testing and calibration services is provided.

**Quebec.**—In 1971, the Quebec Government adopted new legislation dealing with financial aid to industry, which is considered to be among the most comprehensive in North America. Legislation was regrouped into two programs—Bill 20, “an Act respecting industrial development in Quebec” which provided for setting up the Industrial Development Corporation, and Bill 21, “an Act to stimulate industrial development through tax advantages”. The Industrial Development Corporation replaces the former Industrial Credit Board which has been phased out.

The aim of these programs is to assist in the transformation of the industrial structure of Quebec through assistance to technologically advanced industries and through regrouping the production facilities of already existing enterprises to enable them to improve their competitive position. Moreover, firms unable to obtain financial assistance elsewhere at reasonable rates and conditions may benefit under these programs if it is considered that such assistance would contribute to the economic development of the province or of one of its regions. The amount of assistance provided is dependent upon the region involved, the nature of the products being manufactured and the production techniques being used. The new legislation has made possible the consolidation of old programs, further integrating them and, above all, making them complementary to federal legislation in the same field.

The Industrial Development Corporation is authorized to grant financial assistance to a manufacturing firm making an initial investment of at least \$150,000 to build, buy or enlarge a plant or factory, to acquire machinery, tools or equipment, to buy or exploit patents, or to improve the financial structure of the enterprise. The aid may take various forms, depending on the nature and the needs of the firm in question. Such forms include: loans at lower-than-market interest rates; absorption by the Corporation of part of borrowing costs; exemption from repayment of part of loans contracted from the Corporation—a condition subject to certain criteria of productivity and the number of jobs created; purchase by the Corporation of buildings or machinery for resale or lease to a manufacturing enter-

prise; and acquisition by the Corporation of shares in a manufacturing enterprise in a proportion not to exceed at any time more than 30 p.c. of the working capital of such enterprise.

Under the new legislation, the Quebec Government grants tax advantages consisting of a reduction in taxes on company profits with respect to investments in Quebec by manufacturing enterprises on condition that such investment be at least \$150,000. The amounts eligible should be related to building or enlargement of plants or factories or to the purchase of machinery, tools or new equipment. Eligible companies may deduct amounts equalling 30 p.c., 50 p.c. or 100 p.c. of their investment in calculating their profits, depending on the zone where such investment is made.

**Ontario.**—The Province of Ontario gives direct assistance for industrial expansion and increased trade through the Ontario Development Corporation (ODC), a Crown agency for economic and regional development which is answerable to the Legislature through the Minister of Trade and Development. The ODC program provides interest-free performance loans; term loans at reasonable rates of interest; technical and advisory services; and rental and leaseback of manufacturing plants in approved areas. Performance loans, generally representing about one half of approved capital requirement for Canadian-owned companies and about one third for foreign-owned companies, are forgiven over a six-year period as the company meets its commitments. A "Venture Capital for Canadians" fund provides financial assistance to assist with the introduction of new technology, development of export markets or establishment in Ontario of new manufacturing operations in co-operation with other investors. Loans of up to \$50,000 are available to small Canadian-owned companies in all parts of the province to expand their operations in fields of manufacturing or services closely allied to manufacturing. Term financing is provided through mortgages, debentures, etc., in many of Ontario's smaller centres of population. Loans may run up to 20 years and are available for construction of new manufacturing buildings or the extension of existing buildings, and for purchase of new manufacturing equipment that will substantially add to employment. The Corporation may also act as a catalyst in arranging financial packages for companies, and will provide advice on obtaining financing from private lenders, government and other sources.

*Equalization of Industrial Opportunity (EIO).*—Under this program, started in 1967, secondary manufacturing companies establishing new facilities in provincial equalization areas or making approved additions to existing facilities are eligible for EIO loans. The loans are available to companies building new plants and will also apply on new machinery when 75 p.c. of the machinery installed is new.

*Northern Ontario Development.*—The Northern Ontario Development Corporation was formed in 1970, offering loan and advisory services to meet the special requirements of the northern area of the province. This Corporation is part of a large reorganization of services in northern Ontario.

*Trade and Development.*—The Trade and Industry Division of the Department of Trade and Development provides advisory services on financial and marketing matters through four Branches: the Industrial Development Branch provides market research information, details of land and building costs, municipal services, energy and labour costs, incorporation and customs laws, material sources, and transportation facilities; the Marketing Branch assists Ontario companies to export by sending trade missions abroad, by bringing in foreign buyers and through educational programs; the Research Branch provides economic studies for the Division and may also undertake short-term research for industry; and the International Branch operates a trade and industry counselling service in 14 world markets—New York, Chicago, Los Angeles, Boston, Atlanta, Cleveland, Minneapolis/St. Paul, London, Frankfurt, Milan, Stockholm, Vienna, Brussels and Tokyo.

The Department of Trade and Development also operates an immigration service to assist Ontario employers seeking staff,

*The Sheridan Park Research Community.*—The Sheridan Park Corporation has established the Sheridan Park Research Community at Mississauga, which has research laboratories and facilities that offer an interchange of ideas and techniques and help participating companies to stay competitive in world markets. Research creates new and improved products as well as better utilization of natural resources. This unique \$42,000,000 community employs some 1,600 persons in 10 resident companies and corporations.

*The Ontario Economic Council.*—This 20-member advisory group reports to Cabinet on methods to encourage maximum development of human and material resources throughout Ontario. Members of the Council are private citizens who serve without pay. (See Index.)

**Manitoba.**—The Department of Industry and Commerce, established in 1948, is the focal point of provincial government effort in the drive for economic development in Manitoba. To carry forward a comprehensive range of economic development programs, the Department has established various branches and agencies, using an organizational concept that provides industry specialization combined with comprehensive program support.

The Industry Group consists of five Branches with the specific commodity interests of: Food Products; Chemicals; Machinery and Equipment; Industrial Materials and Services; and Consumer Goods. Each is charged with the responsibility of fostering maximum economic growth in its sector, through expansion of existing firms and attraction of new investment. Each has the function of studying trends in its sector, identifying business opportunities, and assisting firms through market research, business development, trade development and casework. The Programs Group has four Branches directly concerned with the implementation of programs in the areas of research and technology, economic and transportation research, management and productivity development and regional development.

Some 50 professionals plan and carry out all programs, consulting and engineering services, and research activities. In addition, the Department works closely with other agencies on matters affecting Manitoba's economic development. The following three associated agencies are special-purpose bodies of private citizens supported by Department staff.

The *Manitoba Export Corporation* assists Manitoba firms in developing export sales. It works closely with each industry Branch and is empowered to appoint agents abroad and to handle exports for Manitoba manufacturers. Services include extensive practical advice on pricing documentation, export procedures and tariffs. The Corporation can assume all the duties of an export department for Manitoba companies. The *Manitoba Design Institute* promotes and encourages the application of industrial design principles in Manitoba companies through a series of seminars, workshops, product evaluation sessions, packaging clinics and direct assistance. The *Manitoba Research Council* serves as a focal point to encourage and co-ordinate technical undertakings in the province. It encourages co-operation between scientists and engineers in government, universities and community colleges, and industry for the purpose of meeting the special needs of the province arising from location, climate and resources. Several programs of innovation assistance have been devised by the council, including an Industrial Enterprise Fellowships program to encourage research teams to use their skills to foster the creation of industrial enterprises. Four advisory committees of council have been commissioned to help develop centres of excellence in research in specific subject areas. A technology transfer program is available to industry, including assistance with licensing arrangements.

The Department of Industry and Commerce has introduced two new programs to provide assistance. The first is the establishment of Industrial Fellowships to stimulate the creation of industrial enterprises and the second is the formation of four committees to help develop centres of excellence in research.

*The Manitoba Development Corporation.*—This is a Crown corporation established in 1958 to provide financing for new and existing manufacturing and processing industries, for the tourist industry and for community development corporations in the province. In considering applications for financial assistance, the Corporation is influenced mainly by sound business practices and the potential contribution to the economic growth of Manitoba, including the creation of employment opportunities. Given these considerations, loans are usually extended when financing is not otherwise available on reasonable terms and conditions, provided the owner has invested a reasonable amount of capital in the business. The terms of repayment can be tailored to suit the requirements of the individual applicant.

Two new divisions have been established. The Small Loans Division provides financial assistance to small businesses in the early stages of growth. In addition to manufacturing and processing industries, certain service industries are also eligible for assistance under this program. The Management Services Division provides financial counselling to Manitoba firms and makes available a broad range of management counselling services to borrowers of the Corporation.

*Manitoba Regional Development Corporations.*—By Manitoba legislation, enacted in 1964, these essentially autonomous organizations came into being to undertake promotion in a wide sphere of regional interests. They were created to promote industrial, commercial and tourist developments in their respective areas and to respond more effectively to the changes taking place in rural areas. They represent a unique instrument in Manitoba and have proved extremely effective in meeting the challenges of regional development through improved communication with people at the regional level. The Department of Industry and Commerce has encouraged the formation of regional development corporations in Manitoba and the Manitoba Government has contributed to their operating costs. At present, seven regional development corporations, encompassing all of Manitoba except Metropolitan Winnipeg, have been formed.

*Manitoba Incentives to Industry.*—The Province of Manitoba offers an improved incentives program for Manitoba companies generally engaged in production/processing, distribution or specialized construction. These incentive programs are offered through the Department of Industry and Commerce to help Manitoba firms pay for growth-plan costs in the following six areas of industrial interest.

- (1) The Feasibility Studies Incentive Program has been established to share the costs incurred by eligible Manitoba companies undertaking feasibility studies to develop plans for company growth and assist in application for grants offered by the federal Department of Regional Economic Expansion.
- (2) Technical Assistance Incentives are available to aid Manitoba firms to retain private consulting and advisory services, thus permitting Manitoba companies to take advantage of modern management techniques to improve manufacturing productivity, product acceptance and organizational control and efficiency.
- (3) Design Improvement Incentives are available to aid Manitoba firms to retain private consulting and advisory services. The purpose is to assist Manitoba companies with the improvement of market acceptance and competitiveness of existing products, with the creation of profitable new products and generally to improve their competitive position in national and international markets.
- (4) The Research and Development Incentives Program enables eligible Manitoba companies to obtain assistance for product innovation and testing. The objective is to encourage the introduction of new products or a radical improvement of existing products, through research and development.
- (5) The Exports Incentives Program assists eligible Manitoba companies seeking new export markets by participating in defraying the costs incurred in approved advertising, sales promotion or merchandising in new export markets.
- (6) The Manpower Development Incentives Program assists Manitoba companies in the establishment of effective manpower development and training programs for employees, through a sharing of costs incurred for the professional advice necessary to set up such programs.

**Saskatchewan.**—Assistance to industry in Saskatchewan is given through the Department of Industry and Commerce, whose activities and programs are carried out through the following Branches. The Industry Development Branch promotes the establishment of new manufacturing and processing operations, resource industries, industrial service and warehouse facilities; assists established companies to expand and/or maintain their manufacturing and service facilities; locates and investigates development opportunities in manufacturing, processing, resource development, service and warehousing; and compiles, publishes and disseminates information on all phases of the province's economic development. The Area and Trade Development Branch identifies export markets for Saskatchewan-made goods and brings these market opportunities to the attention of local manufacturers; initiates export promotion programs for specific industries exhibiting export potential; and works with communities seeking industrial and commercial expansion and maintains close liaison with local industrial development groups and agencies. The Tourist Development Branch undertakes a variety of programs designed to increase public awareness of the province's tourist facilities and attractions, to expand and to improve these recreational and tourist resources; and maintains close liaison with private and public tourist agencies and groups in formulating and carrying out programs for the development of a strong tourist industry. The Business Assistance Branch provides management advice as well as financial assistance to eligible firms to aid in the development and maintenance of small businesses.

*Saskatchewan Economic Development Corporation (SEDCO).*—The province also provides financial assistance to industrial enterprises through SEDCO, a Crown corporation established in 1963 for the purpose of expanding the industrial base of the province through loans for the establishment or expansion of industrial enterprises; a secondary purpose is to provide funds for diversification of agricultural enterprises.

SEDCO assistance can take many forms, the most common of which is a first mortgage loan over a medium term. Security for such loans consists of specific pledges of land, buildings and/or equipment, and the support of the individuals involved in the applicant business is normally pledged as well. Repayment terms for such loans are designed to suit the income pattern of the enterprise, and may include such features as step-payments, seasonal payments or similar arrangements.

The Corporation can also provide working capital loans, but these are available only if normal sources are unwilling or unable to provide the appropriate amount; they may be secured by a pledge of fixed assets or of current assets.

In all cases, the Corporation expects that the owners of the borrowing company will have a reasonable equity contribution in the enterprise. In certain instances, the Corporation will consider making an equity investment in its own right if required to maintain a reasonable balance between debt and equity.

The Corporation also has industrial sites and buildings which it is prepared to make available to eligible enterprises. Lease, lease-purchase or outright sale of such properties can be considered and, in certain circumstances, the Corporation will consider constructing a facility for the subsequent sale or lease to a prospective client.

Enterprises eligible for SEDCO assistance are those engaged in manufacturing, assembly or certain types of intensive agricultural activity. Ownership can take any form and the size may vary from a one-man proprietorship to a multi-national corporation.

**Alberta.**—The Province of Alberta assists industry through the services of the Alberta Commercial Corporation, a Crown corporation established in 1964. As a means of further strengthening the industrial base in the province, a program of financial assistance is offered to new incoming manufacturers as well as to the expansion programs of existing Alberta concerns, and financial assistance is provided in various forms to industries unable to obtain suitable financing through other sources.

The assistance is intended primarily for small manufacturers and producers and provides the financing of inventories of raw and/or finished materials, the financing or re-

financing of plant equipment, the financing of plant-sites including land and buildings and, at present on an experimental basis, the provision of leased premises under sub-lease.

Under the banner "Assistance to Industry", the service operates on an assist basis. The company and its principals are expected to lay the financial foundations and the Alberta Commercial Corporation then fills requirements not provided for by the banks or other lending institutions. Inventory financing is usually limited to about 75 p.c. of costs; on loans covering equipment or plant-sites, the level is set to suit the purpose and usually runs to about 60 p.c. Inventory financing lends itself to the broadest application among manufacturers and producers, since most of such industries face inventory problems and, when these are solved, operating capital problems usually disappear. Hence the service provides an alternative to the facilities of other lending institutions. In these specific areas, the Corporation is unique in Alberta.

Under inventory financing contracts, the Corporation actually purchases and stores inventory for resale to the Alberta industries being served and all benefits, such as savings through bulk buying, etc., go to the industries. Equipment and building finance contracts are designed to suit the needs and plans of the operating company and the periods over which these contracts extend vary with their respective needs. Repayment is made against a blended schedule of monthly payments allowing the company to budget ahead accordingly.

Service under the program is provided through the Corporation's head office in Edmonton and its southern area office in Calgary. Financing programs are individually dealt with through an experienced staff of professional personnel. Applications for assistance call for suitable back-up material, such as financial statements, etc., which is studied and broadly assessed. Applications are considered for approval by the Board of Directors and, normally, funds are available in four to six weeks. All funds employed call for interest at a favourable rate and security is in the form of clear first charges with suitable involvement of the principals and prudent stabilizing of the company's economic structure for the period of the undertaking.

A further and often equally or even more important function of the Corporation is that of providing guidance to small manufacturers and producers in management problems. Such assistance is usually applied, without cost, with the object of helping the manufacturers lay down strong procedural foundations upon which to build and better attract suitable financing as a result. These operations are directed toward regular professional counselling at the earliest suitable time and as soon as budgets allow.

The services of the Corporation are continuously examined and updated as a means of keeping all aspects of the program fully abreast of the changing needs of industry.

**British Columbia.**—The functions of the Department of Industrial Development, Trade and Commerce are to encourage industry, to expand foreign trade, to investigate matters of economic importance, to collect and publish statistical information and to assist in regional industrial development. In these fields, the Department is organized to assist existing activities and encourage new enterprises by placing its facilities at their disposal, and to co-operate in all problems incidental to establishment. Direct financial assistance is not provided for manufacturers except for the provision of bounties for the production of blister copper or refined copper (not yet exercised in mid-1971) and a bounty for pig iron of British Columbia origin used for steel-making purposes in the province.

The chief means employed by the British Columbia Government to promote industrial development are: (1) to develop the basic provincial infrastructure, including the extension of rail services to northern centres by the provincially owned Pacific Great Eastern Railway, and to develop electric power facilities by the British Columbia Hydro and Power Authority; (2) to provide economic data and analyses relating to markets, production wage costs, etc. (a function of the Economics and Statistics Branch of the Department); and (3) to assist in locating plant sites.

The Department maintains industrial and trade offices in London, England, and in San Francisco and Los Angeles.

# CHAPTER XVI.—CAPITAL EXPENDITURES, CONSTRUCTION AND HOUSING\*

## CONSPECTUS

	PAGE		PAGE
SECTION 1. CAPITAL EXPENDITURES ON CON- STRUCTION AND ON MACHINERY AND EQUIPMENT.....	793	SECTION 3. HOUSING.....	809
SECTION 2. CONSTRUCTION STATISTICS.....	801	Subsection 1. Government Aid to House- Building.....	809
Subsection 1. Value of Construction Work Performed.....	801	Subsection 2. Housing Activities, 1961-70..	813
Subsection 2. Building Permits Issued.....	807	Subsection 3. Housing Statistics of the Census.....	819

*The interpretation of the symbols used in the tables throughout the Year Book  
will be found on p. vii of this volume.*

This Chapter provides data on the capital expenditures made by all sectors of the Canadian economy on construction and on machinery and equipment, together with summaries of other available statistics for the construction industry. Section 1 shows the amounts spent by each of the various industrial or economic sectors. Section 2 brings together a number of summaries of related series on construction activity—value of work performed by type of structure, value of materials used, salaries and wages paid, numbers employed, and building permits issued. Government aid to house-building and construction of dwelling units are covered in Section 3.

## Section 1.—Capital Expenditures on Construction and on Machinery and Equipment†

A survey carried out early in 1971 indicated that capital expenditures in Canada by business establishments, institutions, governments and house builders would reach approximately \$19,321,000 during that year. This total represented an increase of 10 p.c. over the \$17,640,000 estimated for 1970. Within the 1971 total, outlays for new construction were expected to rise by some 13 p.c. and those for new machinery and equipment by about 3 p.c. over the level of comparable expenditures incurred in 1970. The capital program planned for 1971, if accomplished, would exceed the year-to-year estimated 4-p.c. increase in investment spending for 1970, and would represent a more rapid rise in investment activity than had been experienced on average over the past decade.

\* Except where otherwise noted, prepared (August 1971) in the Business Finance Division, Statistics Canada.

† Capital expenditure figures for 1969 and earlier years are final and those for 1970 are preliminary and subject to revision at a later date. Capital expenditures for 1969 and 1970, as well as intentions for 1971, appear in greater detail in the publication *Private and Public Investment in Canada, Outlook 1971*, available from Information Canada (Catalogue No. 61-205).

With the exception of manufacturing, planned capital spending for 1971 by all major sectors of the economy was expected to be higher than the 1970 level. Spending plans of business indicated an increase of 6 p.c. and social capital outlays by institutions and governments an increase of 7 p.c. The estimated advance in spending on new dwellings was placed at nearly 24 p.c.

This 1971 pattern of investment expenditures was markedly different from that of 1970, in which year manufacturing investment, the most buoyant area, recorded an increase of 22 p.c., business investment advanced about 8 p.c. and there was little change over 1969 in the level of spending by governments and institutions. Indications were that the composition of the 1971 construction program would also differ to a considerable extent from that of 1970; spending for residential construction was expected to rise by about 24 p.c. compared with a decline of 9 p.c. in 1970, although the advance in non-residential construction would remain at about 9 p.c. as in the previous year.

The breakdown of capital spending plans for 1971 by region indicated that outlays would be higher than in 1970 in all major regions, the projected increases being about 21 p.c. in British Columbia, 13 p.c. in Quebec, 9 p.c. in Ontario, 6 p.c. in the Atlantic region, and 1 p.c. in the Prairie region. Considerable variation existed among the individual provinces of the Atlantic region; in Prince Edward Island, capital outlays were expected to rise by 19 p.c. and in Newfoundland by 10 p.c., while outlays in New Brunswick and Nova Scotia were likely to be only moderately above the 1970 level. In the Prairie region, it was anticipated that spending would increase in Saskatchewan by 4 p.c. and in Alberta by 2 p.c. and would decline in Manitoba by 4 p.c.

The spending sectors contributing to the expected strengths and weaknesses varied from region to region. Business investment was expected to increase in Quebec, Ontario and British Columbia but a moderate decline was indicated in the Atlantic and Prairie regions. The most rapid growth was anticipated in British Columbia where plans by business showed an increase of about 23 p.c., largely attributable to higher spending on primary industries and electric power facilities. In Quebec, business spending was expected to rise by more than 11 p.c. to which the most important contributors were the primary industries and communications sectors. In Ontario, where the rise was estimated at 6 p.c., a substantial decline in manufacturing investment prospects more than offset increases indicated by spending on primary industries and electric power facilities, oil and gas pipelines and commercial buildings. In the Atlantic region, an increase in manufacturing in Newfoundland was more than offset by declines in spending on electric power facilities in that province and in manufacturing in Nova Scotia. In the Prairie region, lower levels of spending by the manufacturing and trade, finance and commercial services sectors accounted for much of the decline indicated in business spending in that region. House-building activities were expected to increase in all regions in 1971, as were social capital outlays; in the latter sector, the largest increase of 14 p.c. was indicated in British Columbia, followed by increases of 8 p.c. in Quebec, 6 p.c. in the Prairie region, 5 p.c. in Ontario and 4 p.c. in the Atlantic region.

It should be noted that, in the smaller provinces in particular, individual projects or special conditions in one industry may have an important bearing on the year-to-year trend in total investment. For example, a decline in outlays by the petroleum and coal industry in Nova Scotia, where some large projects reached the completion stage, accounted for most of the reduction in 1971 business investment in that province. On the other hand, the increase expected in Newfoundland was a result of new projects planned by the paper, petroleum and coal industries. It should also be noted that "actual" outlays in 1971 may differ from the stated intentions as a result of developments occurring as the year progresses.

Table 1 shows the trend in capital spending over the years 1953-71 in both current and constant (1961) dollars. Table 2 gives a summary of capital and repair expenditures by economic sector for 1969-71 and Table 3 contains details of the manufacturing, mining, utilities, trade, institutions, finance and commercial services sectors.

<sup>1</sup> Includes privately operated social and welfare institutions.<sup>2</sup> Mainly expenditures of real estate companies engaged in developing, owning and leasing properties, and may include outlays for multi-purpose developments with such facilities as theatres, stores, hotel accommodation, etc.<sup>3</sup> Includes services to business, certain recreational and personal services and such miscellaneous services as trade and exhibition associations.

A summary of the capital expenditures in each province for the years 1969 to 1971 is given in Table 4. Such expenditures represent gross additions to the capital stocks of the province and are a reflection of economic activity in the area, although the actual production of these assets may generate major employment and income-giving effects in other regions.

**Section 2.—Construction Statistics****Subsection 1.—Value of Construction Work Performed**

Statistics of the construction industry are based largely on information received at the same time and from the same sources as the data on capital expenditures that appear in Section 1. The data represent the estimated total value of all new and repair construction performed by contractors, by labour forces of utility, manufacturing, mining and logging firms, and by government departments, home-owner builders and other persons or firms not primarily engaged in the construction industry. Table 5 shows the value of new and repair construction work performed during the period 1962-70 with intentions for 1971, and Table 6 shows the value of such work performed by contractors and others in the years 1967-71.

In Canada's sub-arctic, at Deception Bay 1,200 miles north of Montreal, is being constructed the largest building of its kind in the world for storage of ungraded asbestos. The area of the building is roughly that of five football fields. The asbestos mill in the area, which will be in production in 1972, will produce about 300,000 tons of ungraded fibre a year.

### 5.—Value of New and Repair Construction Work Performed, 1962-71

Principal statistics of the construction industry are shown by province and for contractors, utilities, governments and others in Table 8. The statistics given for Canada as a whole may be considered as relatively accurate but those for individual provinces and by class of builder are approximations only. All estimates given for cost of materials used are based on ratios of this item to total value of work performed, derived from annual surveys of construction work and applied to the total value-of-work figures. Estimates of labour content are similarly based but, in addition, are adjusted to include working owners and partners and their withdrawals. Although the ratios were calculated in some detail by type of industry, still further refinements are required. There are also some difficulties in obtaining the precise location of projects undertaken or to be undertaken by large companies operating in a number of provinces. However, if used with these qualifications in mind, the table provides useful estimates.

**8.—Labour Content, Cost of Materials and Value of Work Performed in Construction, by Province and by Employer, 1969-71**

NOTE.—Actual expenditures 1969; preliminary 1970; intentions 1971.

**Price Index Numbers of Construction and Capital Goods.**—Reference is made here to Chapter XX, Part IV on Prices. Section 2 of that Part contains index numbers which measure price changes in residential and non-residential building materials and changes in construction wage rates; price indexes of highway construction which express prices paid by provincial governments in contracts awarded for highway construction each year as a percentage of prices paid in 1961; and price indexes of electrical utility construction (distribution systems, transmission lines, transformer stations) which provide an estimate of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping such utilities.

**Subsection 2.—Building Permits Issued**

The estimated value of proposed construction is indicated by the value of building permits issued. Figures of building permits are collected from more than 1,400 municipalities across the country and are available for individual municipalities, for metropolitan areas, for provinces and for economic areas in Quebec, Ontario and Manitoba.

The total value of permits issued for building construction in 1970 was \$4,700,159,000, a figure 4.0 p.c. lower than that in 1969. Residential construction values decreased by 4.9 p.c. and, although the institutional and government permit values increased by 2.2 p.c., the over-all non-residential sector was 3.2 p.c. lower, attributable mainly to a drop of 12.3 p.c. in the industrial permit values.

Permit values in Ontario remained unchanged from 1969, those in Prince Edward Island, Quebec and Manitoba increased and those in all other provinces decreased, Nova Scotia and Saskatchewan experiencing the most serious drop of 39 p.c. The value of building permits issued in each province in the years 1969 and 1970 is given in Table 9, in each of 50 municipalities in Table 10 and in each of the 19 metropolitan areas in Table 11. The latter made up 66 p.c. of the 1970 total for Canada.

## 9.—Value of Building Permits Issued, by Province, 1969 and 1970 with Totals for 1966-70

<sup>1</sup> Although this is a metropolitan area, only St. John's proper is included in the building permits survey.

## Section 3.—Housing\*

### Subsection 1.—Government Aid to House-Building

**Federal Assistance.**—The role of the Federal Government in housing has expanded progressively since the introduction of the first continuing statute in 1935. Although the Government originally entered the housing field in 1918 when it made money available to the provinces for re-lending to municipalities for housing purposes, the first general piece of federal housing legislation was the Dominion Housing Act passed in 1935. This was followed by the National Housing Acts of 1938 and 1944, culminating in 1954 with the present National Housing Act, defined as “an Act to promote the construction of new houses, the repair and modernization of existing houses and the improvement of housing and living conditions”. Central Mortgage and Housing Corporation (CMHC), a Crown agency incorporated by Act of Parliament in 1945, administers the National Housing Act and co-ordinates the activities of the Federal Government in housing. The Corporation has the authority and responsibility for a variety of functions affecting housing in its long-

\* Prepared (August 1971) in the Information Division, Central Mortgage and Housing Corporation, Ottawa.

term outlook as well as in its immediate requirements. It is empowered to act as an insurer of mortgage loans, as a lender or investor of public funds, as a guarantor and as an owner of property and other assets. It also acts as a research agency in fields associated with housing and assists provinces and municipalities in many aspects of urban growth. In general, the Government, through the successive Housing Acts, has attempted to stimulate and supplement the market for housing rather than assume direct responsibilities that rightfully belong to other levels of government or that could be borne more effectively by private enterprise. In each case the aim has been to increase the flow of mortgage money and to encourage lenders to make loans on more favourable terms to prospective home owners. Close to half of the country's present stock of approximately 6,000,000 houses have been built since the first covering legislation was enacted; about one third of these were financed in one way or another under the Housing Acts.

Under the terms of the National Housing Act, 1954 and its subsequent amendments, as now set out in RSC 1970, c. N-10, the Federal Government is active in many ways.

*Loan Insurance.*—Insured mortgage loans may be made for both home-ownership and for rental housing. They are normally available from approved lenders to individual home-owner applicants, to builders constructing houses for sale or for rent and for some special groups, such as co-operative housing associations and farmers. Insured loans are also available for the purchase, improvement, refinancing or sale of existing dwellings.

Prior to June 1969, the maximum interest rate on insured loans was restricted to  $2\frac{1}{4}$  p.c. above the long-term Government bond rate adjusted quarterly to the nearest one eighth of one per cent. Amendment to the National Housing Act, approved June 27, 1969, removed this restriction from all but home improvement loans, thus allowing the NHA interest rate to find its own level in relation to the open market.

Upon application, the borrower pays CMHC a fee of \$35 per unit to help defray expenses incurred in the examination of plans and specifications, in the determination of lending values and in compliance inspections during construction. An approved lender requires evidence that a home owner or home purchaser is providing 5 p.c. of the value of the house from his own resources. For the home owner this equity may be in the form of cash or a combination of cash, land and labour; for the home purchaser it may be in cash or labour. The regulations require that gross debt service—the ratio of repayments of principal and interest plus municipal taxes to the income of the borrower—should not exceed 27 p.c., although instances involving higher ratios may be considered on their merits. The borrower pays an insurance fee which is added to the amount of the loan and is repaid over the term of the mortgage; the fee ranges from  $\frac{7}{8}$  p.c. to  $1\frac{1}{4}$  p.c. of the loan, according to type of unit and time of mortgage advances.

Loans for new home-ownership may be up to 95 p.c. of the first \$20,000 of lending value plus 80 p.c. of the remainder to a maximum loan of \$25,000. For rental housing, loans may be for 90 p.c. of lending value. Loan maxima vary with the type of rental housing but cannot exceed those set for similar dwellings built for home-ownership. Current maxima are: single family units \$25,000; apartment multiple units \$18,000 per unit; and hostels \$7,000 per person accommodated. Loans for existing houses may be 95 p.c. of the lending value, up to a maximum amount of \$18,000 per housing unit. The repayment period may be up to 40 years for new home-ownership and rental housing. For existing home-owner dwellings this period is 40 years or the remaining life of the building whichever is the lesser.

*Direct Loans.*—CMHC may make direct loans for both home-ownership and rental housing where, in the opinion of the Corporation, loans are not available through approved lenders. Loans are made to any eligible home-owner applicant but direct loans to builders are normally subject to a requirement that the houses be pre-sold to satisfactory purchasers. By the end of 1970, direct lending by the Corporation totalled approximately \$4,203,397,000.

CMHC may make loans to any organization, corporation or individual to assist in financing the construction of low-rental housing projects or in the purchase of existing buildings and their conversion into low-rental housing projects. In addition to self-

contained units, developments undertaken may include hostel or dormitory accommodation for elderly and low-income individuals. Loans may be up to a maximum of 95 p.c. of the lending value established by CMHC. The period for repayment may not exceed the useful life of the project and in any case may not be for more than 50 years. The interest rate is established by Order in Council. Plans and specifications for such projects as well as financing and operating arrangements must be approved by the Corporation.

Since December 1960, the National Housing Act has provided financial assistance for the elimination or prevention of water and soil pollution. CMHC is authorized to make a loan to a province, municipality or a municipal sewerage corporation for the purpose of assisting in the construction or expansion of a sewage treatment project. The loan may not exceed two thirds of the cost of the project and the maximum repayment term is 50 years from date of completion. The interest rate is prescribed by the Governor in Council. The agreement covering the project contains a condition whereby 25 p.c. of the loan principal and 25 p.c. of the accrued interest will be forgiven for projects completed to the satisfaction of CMHC on or before Mar. 31, 1975. Where construction is not completed before that date, 25 p.c. of the loan advanced or warrantable by construction progress at that date, plus 25 p.c. of the accrued interest on advances, may be forgiven.

Long-term loans are available to a province or its agency, a municipality or its agency, a hospital, a school board, a university or college, a co-operative association or a charitable corporation for the purpose of assisting in the construction of a student housing project, or the acquisition of existing buildings and their conversion into a student housing project. In all cases, the government of the province concerned must approve the loan. CMHC may lend up to 90 p.c. of the project cost, subject to maximum amounts as follows: \$25,000 per new unit; \$18,000 per self-contained unit or existing housing unit, and \$7,000 per person housed in dormitory or hostel accommodation. The term of the loan may not exceed 50 years. The interest rate is prescribed by the Governor in Council.

*Guarantees.*—CMHC is authorized to give a limited guarantee to banks or approved instalment credit agencies in return for an insurance fee paid by the borrower on loans made for additions, repairs and alterations to existing houses and apartments. A home improvement loan and the balance owing on any existing NHA home improvement loan on the property may not exceed \$4,000 for a one-family dwelling or \$4,000 for the first unit of a duplex, semi-detached or multiple-family dwelling, plus \$1,500 for each additional unit. Loans are repayable in monthly instalments over a period not exceeding 10 years. The maximum rate of interest is restricted to  $2\frac{1}{4}$  p.c. above the long-term Government bond rate adjusted quarterly to the nearest one eighth of one per cent.

*Public Housing.*—Under the National Housing Act and complementary provincial legislation, the Federal Government and the government of a province may enter into a partnership agreement to build rental housing for families and individuals of low income or to purchase and rehabilitate existing housing for this purpose. Projects may include hostel or dormitory accommodation in addition to self-contained units. The Federal Government pays up to 75 p.c. of the capital costs and the provincial government the remainder, although the latter may call upon the municipality concerned to bear a portion of the provincial share. Rents for units in federal-provincial projects are related to the tenant's family income and size of family. Operating deficits are shared on the same contractual basis as the capital costs.

As an alternative method of producing public housing, the CMHC is empowered to make long-term loans to a province, or to a municipality or public housing agency with the approval of the province, for the provision of housing accommodation. Projects may consist of new construction or existing buildings and include dormitory and hostel accommodation as well as self-contained family units. Loans may be up to 90 p.c. of the total costs as determined by CMHC and for a term as long as 50 years but not in excess of the useful life of the development. The maximum that may be borrowed for a fully serviced apartment is \$18,000, and for hostels or dormitories \$7,000 for each person accommodated.

For a house, the maximum is \$25,000. The interest rate is set by the Governor in Council. Where this alternative is selected, federal grants may be made covering up to 50 p.c. of losses incurred in the operation of public housing projects, for a period of up to 50 years but not exceeding the useful life of the project.

*Urban Renewal.*—Federal grants and loans are available under the Act to assist provinces and municipalities undertaking programs of urban renewal. CMHC, with Federal Government approval, may arrange with a municipality to undertake a study to identify blighted areas, determine housing requirements and provide data upon which an orderly program of conservation, rehabilitation and redevelopment can be based. The federal contribution may be as much as 75 p.c. of the cost. The legislation also authorizes federal contributions equal to one half of the costs of preparing an urban renewal scheme setting out proposals for urban renewal action, a similar cost-sharing arrangement for the implementation of a scheme, and loans up to two thirds of the provincial or municipal share of the cost of carrying out an urban renewal scheme. Loans may be for 15 years at an interest rate prescribed by the Governor in Council. To encourage the improvement and conservation of housing meeting minimum standards of construction, loans are available for the sale, purchase or refinancing of existing housing in urban renewal areas not designated for demolition.

Activity under the urban renewal provisions of the National Housing Act was restricted in 1969 following the report of the Task Force on Housing and Urban Development. The report expressed strong reservations about existing approaches to urban renewal and made specific recommendations for the future. As a result of this report, an in-depth study was undertaken with a view to formulating a new federal policy for urban assistance. Preliminary findings indicated that, in the next decade, urban assistance would be based on very different principles to those used in the past. In August 1969 a suspension of federal approval of new projects was put into effect. As an interim measure negotiations were undertaken to permit at least partial implementation of a small number of projects.

*Land Assembly.*—The Federal Government and the government of a province may enter into an agreement to provide for a land assembly project which involves the development of raw land for housing purposes. The Federal Government pays up to 75 p.c. of the cost and the provincial government the remainder. The latter may call upon the municipality concerned to bear a portion of the provincial share. In addition, loans equal to 90 p.c. of the cost of assembling and servicing land for public housing or general housing purposes are available at a preferential interest rate to provinces, municipalities and their agencies.

*CMHC Building.*—The Corporation may construct and administer housing and certain other buildings on its own account and for other government departments and agencies. Its responsibilities include the provision of architectural and engineering designs, the calling of public tenders and the administration of construction contracts—including any necessary on-site surveying and engineering. On such contracts, the Corporation carries out full architectural and engineering inspections.

*Research.*—CMHC is concerned with building technology in the formulation of standards for housing construction, in the use of suitable materials and in the development of new building techniques. The Corporation has no laboratory facilities but has direct experience of performance in the field and seeks the advice of specialists in various agencies and departments of the Federal Government in such matters. Research into the factors affecting housing is concerned with the measurement of the demand for new housing, the volume of new housing built and the supply of mortgage money for house construction. The Corporation also co-ordinates and publishes statistical information on housing. Funds provided under the National Housing Act support the activities of the Canadian Housing Design Council, the Community Planning Association of Canada and the Canadian Council on Urban and Regional Research.

*Other Federal Legislation.*—The Farm Credit Act, 1959 (RSC 1970, c. F-2) provides for federal long-term loan assistance for housing as well as for other farm purposes (see pp. 540-541); the Veterans' Land Act, 1942 (RSC 1970, c. V-4) provides a form of loan and grant assistance to veterans for housing and other purposes (see pp. 366-367); and the Farm Improvement Loans Act, 1944 (RSC 1970, c. F-3) (see pp. 538-539) provides for guarantees for intermediate- and short-term loans made by approved lending agencies to farmers for housing and other purposes. These three statutes are concerned only incidentally with housing.

**Provincial Assistance.**—All provinces have complementary legislation providing for joint federal-provincial housing and land assembly projects and, in addition, most provinces have enacted separate legislation with respect to housing. Details of such assistance may be secured from the provincial government departments listed in the Directory of Sources of Official Information included in Chapter XXVI under the heading of "Housing".

### **Subsection 2.—Housing Activities 1961-70**

More than 1,600,000 dwellings, or about one quarter of the total housing stock of Canada, were built in the 10-year period ended 1970. This activity, much of it taking the form of rental dwellings, accommodated not only the increase in the number of families and the large increase in non-family households that took place during the period, but also permitted a reduction in the number of doubled-up families. Replacements made possible a reduction in the number of obsolete dwellings and, through improvement and modernization, there was a significant upgrading in the quality of existing dwellings.

This improvement in housing conditions was real, however prosaic the indicators by which it has to be measured. In terms of the quality of the housing inventory, it is reasonably certain that the 1971 Census will show that the number of dwellings considered to be in need of major repair during the period dropped from 254,000 to about 140,000 and that the number of homes lacking modern plumbing was down from 891,000 by more than 50 p.c. However, despite these improvements, the marked increase in shelter costs made housing one of the major subjects of public concern during the second half of the decade. The immediate cause of this situation was the inhibiting effect on housing production of a drop in the rate of new construction in combination with an unusually high rate of immigration. The decrease, which began in the latter half of 1965 and continued for the next 18 months, had its origin in the extraordinary concentration of capital investment in fields other than housing. The effect of this decline was felt by all income groups with an immediate interest in housing but became particularly acute for those in the lower third of the income scale.

These circumstances gave rise to significant developments which are going to influence housing progress for the next 10 years. On the one hand, a series of measures was taken to generate a larger volume of new housing production through the operation of the private market; on the other hand there developed, in the mid-1960s, in response to federal measures, provincial commitments to the housing of low-income people on a scale previously unknown. The measures having to do with the private housing market included the removal of impediments to the full participation of the chartered banks in mortgage lending and the freeing of the interest rate on NHA loans. Also included were: the lifting of outdated restrictions on loan-to-value ratios on conventional mortgage loans; efforts to open up a significant secondary mortgage market; the development of private insurance of conventional mortgage loans; and the extension of NHA-insured lending to existing housing. In 1969, five-year renewable mortgages were permitted under the NHA to widen the choice of arrangements open to lenders and borrowers. The increase in the commitment of provincial governments to the housing of low-income people was related, at least in part, to the enactment in 1964 of new provisions for such housing under the National Housing Act. This commitment found immediate expression in the establishment in virtually every province of provincial housing corporations or similar bodies.

The result of these developments was that, in the late 1960s, a demand for federal funds for low-income housing was generated which could be satisfied only by a reduction in other programs under the National Housing Act. This led to a transfer of public aid from support of the private housing market to the direct aid of low-income groups. During the past three years of the decade, the effect of this decision became clearly apparent. In 1968, approval was given to direct loans involving 15,221 dwelling units and hostel accommodation for 15,978 persons of low income, including students. For the year 1970, these figures were 43,494 units and 20,263 hostel beds. The total direct federal investments for these two years were \$257,000,000 and \$596,400,000, respectively.

Dwelling starts in 1970 totalled 190,528 units, 9.5 p.c. below the 1969 record of 210,415 but still the third highest number on record. The decline in the volume of construction, which involved both single and multiple dwellings, was a result of the noticeable drop in conventional mortgage commitments from the private institutional lenders. As previously indicated, direct lending by the CMHC, particularly in the area involving low-income groups, registered a substantial increase.

Out of the initial housing budget of \$854,000,000, later raised to a record high of \$1,094,000,000, two thirds, or about \$570,000,000 was directed toward the provision of housing for low-income families and persons. The additional \$240,000,000, approved in August 1970, was provided to accelerate the rate of housing starts for modest-income families. As a result of this heavy federal investment in housing, about 47,000 new dwelling units were produced for use by these groups, or nearly twice the output for any previous single year.

DWELLING STARTS, BY PRINCIPAL SOURCE OF FINANCING, 1961 - 70

Direct federal support during 1970 involved 68,178 new and 7,910 existing units for a total of 76,088. Hostel accommodation was also provided for 13,093 persons. The total federal investment in housing for the year was \$965,513,000.

Approved lenders' investment in new housing amounted to \$858,000,000 in 1970, up from \$701,000,000 in 1969, the number of new houses financed rising to 53,029 units from 48,695. Included in this total were loan approvals for 7,402 units of condominium housing. The largest annual increase in approved lenders' activity during the latter part of the decade was attributed to chartered banks, followed by trust companies, while life insurance companies reported a sharp decline. In terms of total investment in housing from 1961 to 1970, trust companies lead by a wide margin.

Housing costs as reflected by the consumer price index showed that the cost of rental accommodation has been rising at a much slower rate in recent years than the cost of home-ownership. Rental costs rose by 18.1 p.c. from the end of 1965 to the end of 1970 as compared with an advance of 40.3 p.c. for home-ownership costs during the same period. Average estimated costs of bungalows financed under the National Housing Act increased by 39.2 p.c. between 1961 and 1970, and the average estimated land costs rose by 51.7 p.c.

**Operations under the National Housing Act.**—NHA mortgage loans amounting to \$1,720,089,000 were approved in 1970 for the provision of 116,294 new units and 12,610 hostel beds, compared with loans of \$1,197,228,000 approved for 79,868 new dwellings and 17,235 hostel beds in 1969. Direct lending by CMHC, for the first time since 1967, was above the volume of insured loans by approved lenders operating under the Act; loans by

the federal agency had a value of \$903,408,000 against \$816,681,000 for approved lenders. Loans made available through private lenders in 1970 amounted to \$857,827,000 for 53,029 dwellings. Chartered banks were the largest source of private funds in 1970, approving loans for 19,347 units. Life insurance company loans represented 4,831 units; trust company loans amounted to \$299,517,000 for 19,234 dwellings; and the remaining 9,617 units resulted from activity in the amount of \$145,377,000 on the part of loan and other companies.

**14.—Mortgage Loans Approved by Lending Institutions, by Type of Property and of Loan, 1961-70**

1970.....	858	539	644	508	2,549

*Borrower and House Characteristics.*—The average family income of purchasers of NHA-financed houses in 1970 was \$11,833. These incomes were 9.5 p.c. higher than the corresponding averages for purchasers in 1969 and appeared to be in line with the general increase in incomes in 1970. As in previous years, relatively few purchasers of NHA houses were drawn from the lower third of the range of family incomes. In 1970 only 0.8 p.c. of the borrowers had family incomes of less than \$5,000 as compared with 1.4 p.c. in 1967.

The average age of purchasers of NHA houses was 33.2 years in 1970, slightly higher than in 1969. In 1970, just over one half of the purchasers had two or more children and 27.2 p.c. had previously been home owners.

The average price of NHA-financed single-family dwellings purchased in 1970, including many started in the previous year, was \$21,895. On these houses, purchasers provided down-payments averaging \$4,206 and undertook monthly payments of \$236 for mortgage, principal, interest and taxes. Compared with 1969, these represented increases of 5.4 p.c. in price and 11.5 p.c. in monthly charges and a decrease of 4.3 p.c. in down-payment. The proportion of monthly charges to income increased from 23.5 p.c. to 23.9 p.c.

As in other years, most of the NHA-financed single-detached houses purchased in 1970 were bungalows, which type represented 74.5 p.c. of the total compared with 72.8 p.c. in 1969. The proportion of split-level dwellings decreased from 21.1 to 18.9 p.c. and that of two-storey dwellings from 6.0 p.c. to 5.7 p.c. Of these dwellings about 86.7 p.c. had one to three bedrooms and the remainder had four or more.

*Aid to Low-Income Groups.*—In 1970, loans amounting to a total of \$571,095,000 were approved to assist in the construction of 45,565 self-contained units of low-rental housing and hostel accommodation for 10,109 persons.

*Home Improvement Loans.*—There was an appreciable drop in both the volume and the value of NHA-guaranteed bank loans for home improvement purposes in 1970 as compared with 1969. Loan approvals during the year numbered 7,057 for \$16,852,000 as against

9,142 and \$22,131,000. At the end of 1970, the outstanding debt on such loans was reported by the banks at \$51,000,000 as compared to \$76,200,000 a year earlier. The Home Improvement Loan Insurance Fund increased by \$155,400 during the year for a total reserve of \$3,722,000 at Dec. 31, 1970.

*Loans for Student Housing Projects.\**—Loans totalling \$37,999,000 were approved in 1970 for 22 student housing projects, involving the construction of 588 self-contained units, 5,016 hostel beds, and the purchase and conversion of existing buildings to provide a further 10 beds. Comparable figures for 1969 were 1,610 new units, 8,913 new hostel beds and conversion of existing buildings to provide 23 units and 557 beds.

<sup>1</sup> Provincial data are gross; all others are net.

<sup>2</sup> No loans were approved for student housing projects in Newfoundland, Prince Edward Island, New Brunswick or the Yukon and Northwest Territories.

From December 1960, when student housing loans were first authorized, to December 1970, 267 loans totalling \$385,620,000 were approved involving the construction of 5,373 units and 61,539 beds, and the acquisition and conversion of existing buildings to provide 256 units and 2,715 beds. The statutory limit that may be advanced for such loans is \$550,000,000.

*Loans for Municipal Sewage-Treatment Projects.\**—During 1970, 206 loans amounting to over \$72,487,000 were authorized to assist municipalities to undertake sewage-treatment projects, distributed provincially as follows:—

Province*	Loans	Amount	Province*	Loans	Amount
	No.	\$'000		No.	\$'000
Newfoundland.....	2	398	Ontario.....	55	23,138
Prince Edward Island	1	160	Manitoba.....	17	6,068
Nova Scotia.....	13	2,429	Saskatchewan.....	18	4,330
New Brunswick.....	5	844	Alberta.....	32	5,993
Quebec.....	39	13,498	British Columbia.....	24	14,000

From December 1960, when assistance for sewage-treatment projects was authorized, to December 1970, 1,729 loans totalling \$395,065,000 were approved.

*Mortgage Marketing.*—Sales of NHA-insured mortgages amounted to \$129,900,000 in 1970 compared with \$127,600,000 in 1969. Because of heavy pressure on the market for long-term funds, auctions were not held by the Corporation between 1966 and 1970; total sales by the Corporation to the end of 1965 amounted to \$308,600,000.

*Urban Renewal.*—As indicated in Subsection 1, p. 812, activity under the urban renewal provisions of the National Housing Act was restricted in 1969. During 1970 no new urban renewal studies were initiated. In 1969, four grants totalling \$117,000 were approved for such studies.

\* Provincial data are gross; all others are net.

Federal contributions totalling \$51,000 were approved during 1970 for the preparation of two urban renewal schemes, both in the Province of Quebec. Also, 12 schemes were approved for implementation supported by a federal contribution of \$15,138,000. Together, these involved the rehabilitation of 313 acres and the displacement of 678 families, and the estimated total cost was \$39,282,000. Locations and acreages were: one in Newfoundland involving 104 acres; one in New Brunswick of two acres; four in Quebec of 424 acres; three in Ontario of 108 acres; one in Manitoba of 25 acres; and one in Alberta of 11 acres.

*Public Housing.*—During 1970, approval was given for 32 federal-provincial housing projects—two in Newfoundland, one in Nova Scotia, 14 in Saskatchewan, two in Alberta, 11 in British Columbia and two in the Northwest Territories. These projects will provide 2,224 dwellings and 154 hostel beds and the federal contribution will be \$22,900,000. To the end of 1970, approval had been given for 19,045 rental units under federal-provincial arrangements. Of these, 16,605 are to be subsidized at rents related to the income of tenants and the remainder will be leased at fixed rents related to dwelling size and at levels sufficient to recover capital costs and to meet operating expenses. The federal 75-p.c. share of the deficit of the subsidized units in 1969 paid in 1970 was \$6,000,000.

Under arrangements with the Provinces of Nova Scotia and Prince Edward Island, assistance may be given under the National Housing Act for co-operative house-building. In 1970, loans were approved for 512 units in Nova Scotia, bringing the total approved since the inception of the program in 1953 to 3,149 units. Since 1960, 219 units have been approved in Prince Edward Island.

In April 1965, agreement was reached between the Federal Government and the Province of Saskatchewan for a joint program to provide housing for metis and enfranchised Indians in sparsely settled regions of northern Saskatchewan. During 1969, 74 units were approved, bringing to 202 the total number approved under this experimental program. The units are located at Air Ronge, Beauval, Buffalo Narrows, Cumberland House, Green Lake, Île à la Crosse, La Loche, Turnor Lake, Dore Lake, Pelican Narrows, Pine House, and St. Walburg. The federal contribution for 1970 was \$188,000. Similar agreements have been reached with the Provinces of Manitoba and Alberta directed primarily to people of Indian origin, under which a total of 50 units were approved in 1970 supported by a federal contribution in the amount of \$431,000.

*Loan-Assisted Projects.*—In 1970, 225 loans amounting to \$225,155,000 were approved for 18,413 units: 16 in one project in Newfoundland; 30 in two projects in Nova Scotia; 586 in 24 projects in New Brunswick; 5,392 in 57 projects in Quebec; 10,385 units in 98 projects in Ontario; 864 in 18 projects in Manitoba; and 862 in 20 projects in Alberta.

*Land Assembly.*—Under the federal-provincial arrangements, four land assembly projects for 425 residential building lots were approved in 1970, located in North Preston, N.S.; and Goulbourn Township, Hamilton and Sudbury in Ontario. During 1969, 816 lots were approved for development and approval was also given for the acquisition and ultimate development for housing purposes of 767 acres of land. In 1970, 32 loans were approved, amounting to \$14,337,000, to assist in the acquisition of land for future housing purposes, one in Prince Edward Island, 10 in Nova Scotia, eight in New Brunswick, 12 in Ontario and one in Alberta. By far the largest project is in Edmonton. It involves a loan of \$3,516,000 for the acquisition of 1,028 acres.

### Subsection 3.—Housing Statistics of the Census

Housing data in considerable detail will be available from the 1971 Census and will be published in census bulletins obtainable from Statistics Canada, Ottawa K1A 0T7 (see p. 204). Types and tenure of occupied dwellings, classified by province and by census metropolitan area, as collected in the abbreviated 1966 Census, are given at pp. 840 and 841 of the 1970-71 Year Book.

### Section 1.—The Government in Relation to Labour

#### Subsection 1.—The Canada Department of Labour and the Federal Department of Manpower and Immigration

##### The Canada Department of Labour

The Canada Department of Labour was established in 1900 under the Conciliation Act which provided machinery to aid in preventing and settling labour disputes and required the Department to collect, compile and publish statistical and other relevant information. The Department also assumed the administration of the Fair Wages Policy adopted in the same year for the protection of workmen employed in the execution of Federal Government contracts and on works aided by grants from public funds. Since that time the Department has been charged with the administration of new legislation and has taken on new functions. Its work fell broadly into two main areas—industrial relations and manpower supply—until Jan. 1, 1966, when all manpower activities were transferred to a new Department of Manpower and Immigration (see p. 821).

The legislation now administered by the Canada Department of Labour in the industrial relations area applies to employers, workers and trade unions under federal jurisdiction. The Department is responsible for conciliation procedures in industrial disputes, the investigation of complaints of unfair labour practices, refusals to bargain and violations of legislation, the processing of applications for the certification and decertification of trade unions and the conducting of representation votes. It determines wage rates and hours of work in Federal Government contracts for construction or supplies, and promotes joint

\* Except as otherwise noted, this Chapter has been revised under the direction of the Deputy Minister of the Canada Department of Labour, Ottawa.

labour-management consultation. It also administers legislation to prevent discrimination in employment based on race, religion, colour or national origin and to provide for equal pay for female employees. On July 15, 1971, the Canada Labour Code (RSC 1970, c. L-1) came into force. The Code is divided into five parts, each part absorbing a former Act. The five parts are (former Act in parentheses): Part I, Fair Employment Practices (Canada Fair Employment Practices Act); Part II, Female Employees Equal Pay (Female Employees Equal Pay Act); Part III, Labour Standards (Canada Labour [Standards] Code); Part IV, Safety of Employees (Canada Labour [Safety] Code); and Part V, Industrial Relations (Industrial Relations and Disputes Investigation Act).

For the past 25 years, the Canada Department of Labour has encouraged and assisted in the establishment of labour-management committees in industry and services, a function now administered by the Labour-Management Consultation Branch. There are about 2,700 active committees whose efforts are directed to such subjects as improving work methods, safety, operating efficiency, plant maintenance, eliminating waste, maintaining good morale, promoting educational and training activities, and joint consultation on operational changes brought about by technological change.

Research, involving regular and special surveys and analyses of economic and social trends affecting the labour force, is an important part of the Department's work carried out by the Economics and Research Branch. It studies wages and working conditions, union organization, collective bargaining, industrial relations, labour standards and safety. Through the Women's Bureau, it investigates the problems of women in the labour force. It operates a plan of workmen's compensation for seamen on Canadian ships and arranges workmen's compensation for Federal Government employees. In addition to the publication of statistical reports and the results of research studies, the Department publishes the monthly *Labour Gazette*, maintains records of labour legislation in the provinces and in other countries, operates a labour lending library and provides liaison between the International Labour Organization and the federal and provincial governments.

### **The Department of Manpower and Immigration\***

The fundamental purpose of the Department of Manpower and Immigration is to further the growth of Canada through effective allocation and development of manpower resources in response to the changing needs of the national economy. The Department uses two main channels to ensure that the supply of qualified manpower is adequate to meet the demands of the labour market: (1) counselling, placement and, where necessary, training and relocation of workers, and (2) introduction of new manpower through immigration.

**Operations Canada.**—"Operations Canada" distinguishes the Department's domestic field activities from those at head office and at offices abroad; it comprises five regional headquarters, some 400 Canada Manpower Centres and 80 Canada Immigration Centres. Regional Directors-General, responsible for both manpower and immigration activities in the field, report to the Assistant Deputy Minister, Operations, at head office.

The objectives of Operations Canada are: (1) to provide, through strategically located Canada Manpower Centres, the facilities for an effective employment service for both workers and employers; (2) to help workers utilize their maximum potential through counselling or referral to manpower development programs and obtain jobs which match their skills, capabilities and needs; (3) to assist employers in the recruitment of skilled workers, and offer advice in their manpower planning by providing up-to-date occupational and labour market information; (4) to help workers adapt to economic and technological change by encouraging employers and workers to co-operatively pre-plan, and through the use of departmental training and mobility programs; (5) to provide services for the reception, settlement and job placement of immigrants; and (6) to process international travellers and enforce the Immigration Act and Regulations within Canada, providing facilities to process applications by Canadians wishing to sponsor or nominate relatives.

\* Prepared by the Information Service, Department of Manpower and Immigration, Ottawa.

In the 12-month period ended Mar. 31, 1971, Canada Manpower Centres assisted some 649,000 persons, excluding casual workers, to find gainful employment and referred almost 345,000 clients to full-time or part-time upgrading or skill-development training courses under the Canada Manpower Training Program. In the same period, some 16,000 handicapped clients were referred to federal-provincial rehabilitation assistance programs and about 85,000 workers and trainees received moving and transportation assistance under the Canada Manpower Mobility Program.

**Manpower Division.**—Under the Assistant Deputy Minister, Manpower, this Division provides functional support for the manpower areas of Operations Canada; it consists of three units—the Activities Development Branch, the Manpower Utilization Branch and the Programs Branch.

The Activities Development Branch deals with the demand side of the labour market, providing guidelines in the following main areas: development and utilization of departmental services for employers; specialized information on industrial needs; and organization of Canada Manpower Centres to give effective employment service to employers. It also directs the operations of the Manpower Consultative Service which administers Federal Government assistance to industries undergoing manpower dislocations resulting from technological and other changes.

The Manpower Utilization Branch is concerned with the supply side of the labour market. It formulates policies and guidelines for the provision of employment services to workers and promotes the use of Canada Manpower Centres; develops aptitude and achievement tests for use in counselling and selection; advises on methods of matching jobs and workers; and advises on the manpower utilization of special groups such as youths, handicapped persons, immigrants, migrants and indigenous people. The Branch administers the Vocational Rehabilitation of Disabled Persons Act under which the Federal Government shares equally with participating provinces in the costs of vocational rehabilitation services to disabled persons, and the Operation Retrieval program which is designed to put Canadian employers interested in hiring new university graduates in touch with Canadians studying abroad. The Branch carries on a continuing educational program designed to create a more favourable employment climate for middle-aged and older workers, as well as a program to facilitate and encourage the employment of high school and university students during the summer months.

The Programs Branch deals with the major programs that facilitate the matching of labour market supply and demand. It administers the Canada Manpower Training Program which provides for the training or retraining of adults in schools and industry, and the Canada Manpower Mobility Program which facilitates the movement of workers to areas of job opportunity.

Under the "Canada Works" Special Employment Plan introduced Oct. 14, 1971, the Federal Government announced the allocation of \$578,000,000 to reinforce the economy by providing new jobs for Canadians and to contribute to the betterment of Canadian communities, a major innovative feature of which was the \$150,000,000 Local Initiatives Program which produced more than 90,000 jobs. A Training-on-the-Job Program to provide training for more than 42,000 Canadian trainees, an extension of the Canada Manpower Training Program, special loans to the provinces, a federal work intensive program, loans for agricultural fairs and accelerated loans for housing made up the remainder.

**Immigration Division.**—Under the Assistant Deputy Minister, Immigration, the Home Service Branch of the Division provides procedural guidelines for field operations in Canada relating to admission of immigrants and non-immigrants, apprehension of persons who contravene Canadian laws after being admitted or gaining illegal entry, and removal from the country of those liable to deportation.

*Men already in the labour force are trained to repair or to run the big rigs that are the backbone of the construction industry. This unique course, planned to train about 200 men a year, is given on farm land outside of Montreal under the direction of the Quebec Department of Education and with the financial backing of the federal Department of Manpower.*

## Subsection 2.—Federal Labour Legislation and Provincial Labour Legislation

### Federal Labour Legislation

**Fair Wages Policy.**—The Fair Wages Policy applying to all Federal Government contracts was first set forth in a Resolution of the House of Commons (1900) and later incorporated in an Order in Council and amended from time to time. Wages and hours on contracts for construction are now regulated by the Fair Wages and Hours of Labour Act (RSC 1970, c. L-3), and by the Fair Wages and Hours of Labour Regulations. Hours of work on construction contracts are limited to eight a day and 48 in a week, except in exceptional circumstances approved by the Minister or in such cases as the Governor in Council may prescribe; hours worked in excess of eight in a day or 40 in a week must be paid for at an overtime rate at least equal to one and one half times the rates required under the contract; wages to be paid are those current for the type of work in the district or, if there are no current rates, fair and reasonable rates as determined by the Minister of Labour; in no case shall the rates be less than the minimum hourly rate prescribed by or pursuant to Part IV, Labour Standards of the Canada Labour Code.\*

Wages and hours of work on contracts for equipment and supplies are regulated by Order in Council PC 1954-2029. The hours of such work must be those fixed by the custom of the trade in the district where the work is performed, or fair and reasonable hours. The wages must be current or fair and reasonable but in no event shall they be less than those established by statute or regulation of the province in which the work is being performed.

The Fair Wages and Hours of Labour Regulations and Order in Council PC 1954-2029 each contain a clause prohibiting discrimination against any person in matters of employment because of that person's race, national origin, colour or religion, or because he has made a complaint or given information with respect to such alleged discrimination.

\* See also p. 821.

**Industrial Relations.**—Legislation bringing into effect the Industrial Relations and Disputes Investigation Act was proclaimed on Sept. 1, 1948, revoking the Wartime Labour Relations Regulations in effect since March 1944 and repealing the Industrial Disputes Investigation Act which had been in force from 1907 until suspended by the Wartime Regulations in 1944. It protects proceedings commenced and decisions, orders and certifications made under the wartime legislation in so far as these involve services authorized by the Act. It is now Part V of the Canada Labour Code.\*

The Act applies only to industries within federal jurisdiction, viz., navigation, shipping, interprovincial railways, canals, telegraphs, steamship lines and ferries, both international and interprovincial, aerodromes and air transportation, radio broadcasting stations, and works declared by Parliament to be for the general advantage of Canada or of two or more provinces. However, it provides that provincial authorities if they so desire may enact similar legislation for application to employees within provincial jurisdiction and make mutually satisfactory arrangements with the Federal Government for administration of such legislation by the federal authorities.

In general, its important features provide that employees and employers shall have the right to organize and bargain collectively and that trade unions may be certified as bargaining agents for employee groups. Trade unions and employers are required, upon notice, to bargain collectively in good faith. The Act provides for invoking collective bargaining negotiations and for the mediation of conciliation officers and conciliation boards in reaching collective agreements. Employees may change bargaining agents at times under conditions specified in the Act, which also prescribes conditions affecting the duration and renewal of collective agreements. Collective agreements are required to contain provision for the arbitration of disputes concerning the meaning or violation of such agreements and, where such provision is lacking, application may be made for its establishment. It prohibits unfair labour practices, i.e., the interference with or domination of trade unions by employers or interference, discrimination and coercion in trade union activity. The conditions that must be observed prior to strike and lockout action are set down in the Act. Industrial inquiry commissions may be appointed to investigate industrial matters or disputes. The Minister of Labour is charged with its administration and is directly responsible for the provisions affecting the appointment of conciliation officers, conciliation boards, industrial inquiry commissions, consent to prosecute, and complaints that the Act has been violated or that a party has failed to bargain in good faith. The Canada Labour Relations Board administers provisions concerning the certification of bargaining agents and the writing of a procedure into a collective agreement for the final settlement of disputes concerning the meaning or violation of such agreement.

Detailed statistics concerning activities under the Act may be found in the Annual Report of the Canada Department of Labour.

**Fair Employment Practices.**—The Canada Fair Employment Practices Act, which came into effect on July 1, 1953, prohibits discrimination in employment based on race, colour, religion or national origin. It applies only to industries within federal jurisdiction—those covered by the Industrial Relations and Disputes Investigation Act (see above). This law prohibits acts of discrimination by employers; discrimination by trade unions in regard to membership or employment; the use by employers of employment agencies that practise discrimination; and the use of advertisements or inquiries in connection with employment that express, directly or indirectly, any limitation, specification or preference as to race, colour, religion or national origin. It is now Part I of the Canada Labour Code.\*

**Female Employees Equal Pay.**—The Female Employees Equal Pay Act came into effect on Oct. 1, 1956 and applies to employers and employees engaged in works, undertakings or businesses coming within federal jurisdiction and, in its principal provision,

\* See also p. 821.

prohibits an employer from employing a female for any work at a rate of pay that is less than the rate at which a male is employed by that employer for identical or substantially identical work. It is now Part II of the Canada Labour Code.\*

**Labour Standards.**—The Canada Labour (Standards) Code received Royal Assent on Mar. 18, 1965, when the administration and general provisions of Part V came into effect. It provides, in Parts I to IV which came into force on July 1, 1965, minimum standards with respect to hours of work, minimum wages, annual vacations and general holidays in industries under federal jurisdiction; the Annual Vacations Act 1958 was repealed. This Code is now Part III of the Canada Labour Code.\*

The standard hours of work are eight a day and 40 a week, with maximum hours of 48 a week. Overtime pay at not less than time-and-one-half is required for all hours worked in excess of the standard hours. Permits are required in order to work more than 48 hours a week. Where the nature of the work necessitates irregular distribution of hours of work, the hours may be averaged over a period of two weeks or more.

The minimum wage is \$1.75 an hour for all persons 17 years of age or over and the minimum wage for persons under 17 years of age is \$1.50 an hour. Special rates may be set for persons receiving on-the-job training and for disabled or handicapped persons.

Employees are entitled to a two-week vacation with pay after one year of employment, with vacation pay calculated at 4 p.c. of wages. The general holidays are eight in number and every employee is entitled to a holiday with pay on each of them, or substitutes for them. Pursuant to an amendment to Part IV of the Canada Labour (Standards) Code, the Multi-employer Employment (Longshoring) Regulations have been passed to provide for the granting of pay in lieu of general holidays to longshoremen in multi-employer employment who previously could not qualify for general holiday benefits because they did not have sufficient employment with one employer.

The Canada Labour (Standards) Code has special and transitional provisions. Any person may make a submission (under Sect. 51) for deferment or suspension of Part I (Hours of Work). The Minister may grant deferment or suspension where it can be shown that the application of Part I is or would be prejudicial to the interests of the employees or detrimental to the operation of the business. The Minister's order to defer or suspend may be for a period up to but not exceeding 18 months from the date of the order, and the order may or may not contain conditions on hours. A further deferment or suspension may be made by the Governor in Council but only after there has been an inquiry, and the order of the Governor in Council must contain conditions on hours of work. Regulations have been enacted to carry out its purposes.

**Safety of Employees.**—The Canada Labour (Safety) Code, which received Royal Assent in late 1966 and was proclaimed in effect as of Jan. 1, 1968, is the first general safety legislation to be passed by the Parliament of Canada. Its primary purpose is to ensure safe working conditions for all employees in industries and undertakings under federal jurisdiction. Its main features are that: (1) it provides for all the elements of a complete industrial safety program; (2) it sets out the general obligation of employers and employees to carry out their duties in a safe manner and authorizes the making of regulations for dealing with problems of occupational safety; (3) it does not override but complements other federal laws and provincial legislation, thus strengthening the safety movement; (4) it authorizes the use of advisory committees and special task forces to assist in developing the program, all to be done under continuous consultation among federal and provincial government departments, industry and organized labour; and (5) it provides for research into causes and prevention of accidents and for an extended program of safety education. It is applied through regional safety officers and the federally authorized provincial inspectors. Development of regulations continues. It is now Part IV of the Canada Labour Code.\*

### Provincial Labour Legislation

Because of the authority given by the British North America Act to the provincial legislatures to make laws in relation to local works and undertakings and in relation to property and civil rights in the province, power to enact labour legislation is largely the prerogative of the provinces. Since it imposes conditions on the rights of the employer and employee to enter into a contract of employment, labour legislation is, generally speaking, law in relation to civil rights. Under this authority, the provincial legislatures have enacted a large body of legislation affecting the employment relationship in such fields as working hours, minimum wages, the physical conditions of workplaces, apprenticeship and training, wage payment and wage collection, labour-management relations, workmen's compensation and other matters. In each province a department of labour or department of labour and manpower (the designations vary) is charged with the administration of labour laws. Legislation for the protection of miners is administered by departments dealing with mines. The workmen's compensation law in each province is administered by a workmen's compensation board appointed by the Lieutenant-Governor in Council.

**Minimum Wages.**—As a means of ensuring adequate living standards for workers, all jurisdictions have enacted minimum wage legislation. These laws vest in a minimum-wage-fixing board or the Lieutenant-Governor in Council authority to establish minimum wages for employees. In most provinces, minimum wage orders now cover almost all employment except farm labour and domestic service; however, farm labourers are covered in Newfoundland and certain farm-related occupations are covered in Ontario. Minimum rates set by the orders apply throughout the province except in Nova Scotia, Quebec and Saskatchewan. Both Nova Scotia and Saskatchewan are divided into two zones for minimum wage-setting purposes. Except in Newfoundland, Nova Scotia and Prince Edward Island, the same rates are set for both sexes. Most jurisdictions also set special minimum rates for young workers.

**Hours of Work.**—Five provinces have general hours-of-work laws. Those of Ontario, Alberta and British Columbia set limits on daily and weekly hours of work. Hours are limited in Alberta and British Columbia to eight a day and 44 a week, and in Ontario to eight a day and 48 a week. The Ontario Act requires, with some exceptions, that one and one half times the regular rate be paid for work done, under permit, beyond the 48-hour limit. The Manitoba and Saskatchewan Acts do not limit daily and weekly hours but require the payment of one and one half times the regular rate if work is continued after eight and 44 hours. Some exceptions are provided for in all five Acts.

**Regulation of Wages and Hours in Certain Industries.**—Apart from general hours-of-work laws, other statutes regulate working hours in some industries. Industrial standards legislation is in effect in Newfoundland, Prince Edward Island, Nova Scotia, New Brunswick, Ontario, Saskatchewan and Alberta. These laws provide that a schedule of wage rates and hours of work agreed upon by a representative group of employees and employers in an industry or trade may, upon approval by the government, be given statutory effect by Order in Council, with the result that such wage rates and hours become the minimum terms of employment for the entire industry or trade in the area. An advisory committee, usually equally representative of employers and employees, is established to assist in enforcing a schedule. This legislation is used fairly extensively in the building trades, the clothing industries, barbering, and a few other industries. In Newfoundland, Nova Scotia and New Brunswick, schedules have been issued only for certain construction trades in some areas. In Ontario, schedules for the garment trades and the fur industry apply throughout the province and a substantial number of schedules apply to various construction trades and to barbering in specified areas.

Under the Quebec Collective Agreement Decrees Act, certain terms of a collective agreement, including those dealing with hours and wages, may be made binding on all employers and employees in the industry concerned in a defined area, provided the parties to the agreement represent a sufficient proportion of the industry. The standards made binding under this procedure are contained in a decree, which has the force of law. Approximately 85 decrees applying to the garment trades, barbering and hairdressing, commercial establishments, garages and service stations, and other industries and services are in effect. A number of these decrees apply throughout the province. Working conditions in the construction industry are governed by decrees under a separate Act—the Construction Industry Labour Relations Act, 1968.

The Construction Industry Wages Act in Manitoba, which applies to both private and public construction work, provides for the setting of minimum rates of wages and maximum hours of work at regular rates for employees in the construction industry, on the recommendations of a board equally representative of employers and employees, with a public member as chairman. Under this Act, annual schedules set the regular work week and hourly rates of wages for various classifications of workers in the heavy construction industry, in the Greater Winnipeg building construction industry, and in rural building construction.

**Annual Vacations and Public Holidays.**—All provinces have annual vacations legislation applicable to most industries. In Prince Edward Island and New Brunswick, workers are entitled to a vacation of one week after a year of service; in Ontario, workers are entitled to a vacation of one week after the first year of employment, and of two weeks after the second and each subsequent year. In Nova Scotia, Quebec, Newfoundland and the four western provinces, the annual paid vacation required by law is two weeks after a year of service and, in Saskatchewan, three weeks after five years of service.

Six provinces—Alberta, British Columbia, Manitoba, Nova Scotia, Ontario and Saskatchewan—have enacted legislation of general application dealing with public holidays. The number of holidays named varies from seven to nine and the provisions for payment also vary.

**Anti-discrimination Laws.**—All provinces have adopted fair employment practices laws forbidding discrimination in hiring and conditions of employment and in trade union membership on grounds of race, colour, religion or national origin, and on grounds of social origin in Newfoundland and Quebec, and political opinion in Newfoundland. The British Columbia, Manitoba, Newfoundland and Quebec Acts also forbid discrimination in these areas on grounds of sex. In addition, in British Columbia, Ontario and Newfoundland, discrimination in employment and trade union membership on grounds of age is prohibited. Nine provinces have provisions in separate equal pay Acts or in human rights or labour standards legislation that forbid discrimination in rates of pay solely on the basis of sex. Quebec does not have equal pay legislation but, as indicated above, forbids discrimination in employment on the basis of sex.

**Accident Prevention.**—Factory or industrial safety Acts in most provinces establish safeguards for the protection of the health and safety of workers in factories and other workplaces with respect to such matters as sanitation, hearing, lighting, ventilation and the guarding of dangerous machinery. Most workmen's compensation boards have developed comprehensive safety regulations. Long-established laws regulating the design, construction, installation and operation of mechanical equipment, such as boilers and pressure vessels, elevators and lifts, and electrical installations, have been revised in recent years in line with technological changes, and legal standards have been set in new fields involving hazards to workers and the public, such as the use of gas- and oil-burning equipment, and radiation-

producing equipment such as laser sources. This legislation also prescribes standards of qualification for workers who install, operate or service such equipment. Laws requiring safety standards to be observed in construction and excavation work are in force in most provinces.

**Labour Relations.**—In all provinces, there is legislation similar in principle to the federal Industrial Relations and Disputes Investigation Act,\* designed to establish harmonious relations between employers and employees and to facilitate the settlement of industrial disputes. These laws guarantee freedom of association and the right to organize, establish machinery (labour relations boards or other administrative systems) for the certification of a trade union as the exclusive bargaining agent of an appropriate unit of employees, and require an employer to bargain with the certified trade union representing his employees. The laws require the parties to comply with the conciliation or mediation procedures laid down in the legislation before a strike or lockout may legally take place, and they also provide that every collective agreement must contain provisions for the settlement of disputes arising out of the agreement, and prohibit strikes and lockouts while an agreement is in effect. All of them prohibit defined unfair labour practices and prescribe penalties. In most provinces, certain classes of employees who are engaged in essential services, such as policemen and firemen, are forbidden to strike and, in lieu of the right to strike, have recourse to final and binding arbitration. There are provisions relating to hospital disputes in seven provinces.

**Certification of Qualified Tradesmen.**—All provinces have apprenticeship laws providing for an organized procedure of on-the-job training and school instruction in designated skilled trades, and statutory provision is made in most provinces for the issuing of certificates of qualification, on application, to qualified tradesmen in certain trades. In some provinces, legislation is in effect making it mandatory for certain classes of tradesmen to hold certificate of competency.

**Changes in 1970.**†—In the field of labour relations, extensive amendments were made to the Alberta Act providing, among other things, for registered trade union and employers' organizations to be legal entities for prosecutions and actions to sue for purposes of the Act. All picketing, except by trade union members or persons authorized by a trade union during a legal strike or lockout, is forbidden. Picketing must be peaceful. Employers' organizations may be accredited as bargaining agents in the construction industry. Five employer organizations in Quebec are recognized in construction decrees under the Labour Relations Act. A British Columbia amendment does not limit such accreditation to the construction industry. Ontario has similar provisions and, in that jurisdiction, employees are entitled to job reinstatement after a legal strike.

Several provinces enacted or amended labour relations legislation in the public sector. In Newfoundland, the Public Service (Collective Bargaining) Act is to be proclaimed, giving public servants, other government employees and hospital employees collective bargaining rights, including the right to strike. The Civil Service Department Act in Quebec created a central agency to co-ordinate administrative services including collective bargaining. Manitoba substituted binding arbitration in place of mediation as the final step in collective bargaining under the Civil Service Act.

Amendments were made to several *minimum wage* Acts, and the general minimum wage rates in eight provinces and the Yukon Territory were increased. Quebec, in orders governing the service industries and the hotel and restaurant industry, is abolishing the zoning system which divided the province into two zones—Greater Montreal and the remainder of the province. As of May 1, 1971, the orders introduce province-wide rates.

\* See also p. 824.

† For 1970 changes in workmen's compensation legislation, see p. 831.

The general hourly minimum rates applying to most types of employment in the various jurisdictions are as follows:—

#### MINIMUM WAGE RATES FOR EXPERIENCED ADULT WORKERS, JULY 1, 1971

Federal.....	\$1.75 an hour
Newfoundland.....	\$1.25 an hour (men) and \$1 an hour (women)
Prince Edward Island.....	\$1.25 an hour (men) and 95 cents an hour (women)
Nova Scotia.....	\$1.35 and \$1.25 an hour, varying with the zone (men) and \$1.20 and \$1.10 an hour, varying with the zone (women)
New Brunswick.....	\$1.15 an hour; \$1.25 an hour from Sept. 1, 1971; \$1.40 an hour from Mar. 1, 1972; \$1.50 an hour from Jan. 1, 1973
Quebec.....	\$1.45 an hour; \$1.50 an hour from Nov. 1, 1971
Ontario.....	\$1.65 an hour
Manitoba.....	\$1.50 an hour
Saskatchewan.....	\$1.50 an hour (ten cities and a five-mile radius); \$1.40 an hour (elsewhere in province)
Alberta.....	\$1.55 an hour
British Columbia.....	\$1.50 an hour
Northwest Territories.....	\$1.50 an hour
Yukon Territory.....	\$1.50 an hour

Special minimum wage rates set for an industry, occupation or class of employees may be higher or lower than the general rate but in many cases are higher, particularly where a rate is set for a craft or skill.

Ontario amended the Employment Standards Act providing employees with entitlement to a two-week annual vacation with pay after two years of employment rather than after four years. The provision of a one-week vacation after the first year of employment continues in effect. Employees who have completed 12 months of non-continuous employment in any period of 36 months after 1966 are entitled to a vacation.

Annual vacations with pay in the various jurisdictions are as follows:—

#### ANNUAL VACATIONS WITH PAY PROVISIONS, DECEMBER 1970

<u>Jurisdiction</u>	<u>Length of Annual Vacation</u>	<u>Vacation Pay</u>
Federal.....	2 weeks.....	4 p.c. of annual earnings
Newfoundland.....	2 weeks.....	4 p.c. of annual earnings
Prince Edward Island.....	1 week.....	2 p.c. of annual earnings
Nova Scotia.....	2 weeks.....	4 p.c. of annual earnings
New Brunswick (July 1, 1971)...	2 weeks.....	4 p.c. of annual earnings
Quebec.....	2 weeks.....	4 p.c. of annual earnings
Ontario.....	1 week; 2 weeks after 2 years of service	2 p.c. of annual earnings in first year; 4 p.c. of annual earnings in second year
Manitoba.....	2 weeks.....	Regular pay
Saskatchewan.....	2 weeks; 3 weeks after 5 years of service	1/26th of annual earnings in first four years; 3/52nds of annual earnings after fifth year
Alberta.....	2 weeks.....	Regular pay
British Columbia.....	2 weeks.....	4 p.c. of annual earnings

Ontario enacted legislation requiring employers to give written *notice of termination of employment* in cases of individual and collective dismissal. Quebec also requires notice of mass lay-offs. Five other provinces already have statutory notice requirements regarding individual notice. The Ontario Women's Equal Employment Opportunity Act, 1970, which prohibits discrimination in employment on grounds of sex or marital status, also contains *maternity protection*, including leave of absence and prohibition of dismissal for pregnancy. Two other provincial jurisdictions, British Columbia and New Brunswick, have similar legislation. In the field of *fair employment practices*, Manitoba consolidated two previous Acts (Fair Employment Practices and Fair Accommodation Practices), revising and strengthening the provisions at the same time, to produce the Manitoba Human Rights Act. Five provinces forbid discrimination in employment and trade union

membership on grounds of *sex* (British Columbia, Newfoundland, Quebec, Manitoba and New Brunswick); British Columbia, Ontario and Newfoundland prohibit *age* discrimination in the same areas.

In the *industrial safety* field, the Yukon Territory forged the last link in Canada's chain of elevator safety legislation with the enactment of the Elevator and Fixed Conveyances Ordinance, which is to come into force on a date fixed by the Commissioner. Quebec issued detailed new regulations respecting safety in public buildings (including elevating devices).

The Quebec Workmen's Compensation Commission established an Advisory Committee on Industrial Accidents comparable to the Advisory Council on Labour and Manpower. The Committee, composed of workers' and employers' representatives, is to study and advise the Commission on questions concerning the prevention of occupational accidents and diseases and the medical and social rehabilitation of injured workers.

Four provinces—British Columbia, Manitoba, Ontario and Saskatchewan—amended their mines safety legislation.

Alberta enacted comprehensive Electrical Safety Rules, a Radiation Protection Act and, under the Public Health Act, two important sets of regulations. One is a Laser Code of Practice to protect persons from laser, and the other a schedule of notifiable industrial diseases and provision for notification, inspection and control where such diseases occur.

**Workmen's Compensation.**—In all provinces, legislation is in force providing for payment of compensation to workmen who are injured by accident arising out of and in the course of their employment or who are disabled as a result of a specified industrial disease. To be entitled to benefits, a workman must be employed in an industry covered by the Act at the time of the injury. Compensation is not payable, however, where the disability lasts less than a stated number of days (varying from one to four in the provincial Acts), or where the injury is due to the workman's own misconduct. A workman who is entitled to compensation has no right of action against his employer for injury sustained during employment.

The Acts provide for a compulsory system of collective liability on the part of employers. Industries covered are divided into classes or groups, according to hazard. Employers are required to contribute to the Accident Fund at a rate fixed in accordance with the accident experience of the class or group. Each class is liable for the costs of all accidents occurring in that class.

The laws apply to enumerated employments but the range of industries covered by each Act is very wide. The principal exceptions are farm workers (who are not covered except in Ontario), domestic servants, casual workers, employees of financial, insurance and professional undertakings, employees of non-profit religious or charitable organizations, and workers in certain service industries in most provinces, for example, barber shops and beauty parlours. Small undertakings, i.e., those with fewer than a specified number of employees, are exempted from the Act in some provinces. Excluded employments may generally be brought under the Act on the voluntary application of the employer. Quebec intends to bring all industries except agriculture and domestic service within the scope of the Act by October 1971.

Benefits for disability are based on 75 p.c. of earnings, subject to an annual ceiling. Where disability is permanent, a life pension is paid, irrespective of future earnings. Medical benefits are provided without limitation, regardless of a waiting period, and rehabilitation services are available where necessary. Where death results from an employment injury, fixed monthly payments are made to dependants.

A federal Act provides for compensation for accidents to Federal Government employees according to the scale of benefits provided by the Act of the province in which the employee is usually employed. Seamen who are not under a provincial Workmen's Compensation Act are entitled to compensation under the federal Merchant Seamen Compensation Act.

*Changes in 1970-71.*—The workmen's compensation laws of seven provinces and the Yukon Territory and the federal Merchant Seamen Compensation Act were amended. Newfoundland became the second province (after British Columbia) to make provision for an automatic increase of \$1,000 in the earnings ceiling, when earnings have increased in line with a formula contained in the Act. The first such increase in British Columbia, raising the ceiling from \$6,600 to \$7,600 was effective Jan. 1, 1971.

Almost all the amending Acts raised the maximum annual earnings on which compensation payments are based. The new ceilings, as of the effective date in each case, are: \$7,000 in Newfoundland, New Brunswick and Nova Scotia; \$8,000 in Manitoba; \$9,000 in Ontario; and \$6,000 under the Merchant Seamen Compensation Act.

Higher minimum payments for total disability were established in Newfoundland and Saskatchewan and, as a result of the rise in the Consumer Price Index in 1970, in British Columbia. The new minima, including those fixed under the Merchant Seamen Compensation Act are:—

<i>Province or Act</i>	<i>Permanent Total Disability</i>	<i>Temporary Total Disability</i>
Newfoundland.....	\$130 a month or earnings, if less	\$30 a week or earnings, if less
Saskatchewan.....	\$40 a week	\$40 a week or earnings, if less
British Columbia.....	\$168.92 a month	\$36.57 a week or earnings, if less
Merchant Seamen Compensation Act.....	\$35 a week or earnings, if less	\$35 a week or earnings, if less

Changes in dependants' allowances included increases in a widow's monthly pension in six jurisdictions: Prince Edward Island from \$75 to \$100; Nova Scotia from \$100 to \$115; Newfoundland from \$100 to \$120; Saskatchewan from \$115 to \$127.50; Ontario from \$125 to \$175; merchant seamen from \$75 to \$100. Children's monthly allowances were raised by \$5 in Newfoundland (to \$40 for a child with one parent and \$50 for an orphan); by \$10 in Ontario (to \$60 and \$70); and by \$10 under the Merchant Seamen Compensation Act (to \$35 and \$45). The maximum burial allowance for merchant seamen was increased from \$300 to \$400.

A new provision in the Yukon Ordinance allows payments to be made to dependants or to the Territory where a person serving a prison sentence becomes entitled to compensation payments because of a work release program or other circumstances.

A growing trend is for jurisdictions to establish reciprocal agreements. In this regard, Newfoundland and the Yukon Territory made provision for reciprocity in the case of silicosis victims under certain conditions. Manitoba and Saskatchewan made amendments of more general nature. An amendment to the Nova Scotia Act protects workers employed outside the province (particularly fishermen).

## Section 2.—The Labour Force\*

Since 1946, reliable information for analysis of employment in Canada, at the national level and for the five major regions, has been provided through a labour force survey. Between November 1945 and November 1952, quarterly surveys were undertaken and since then the survey has been carried out on a monthly basis. The sample used in the survey has been designed to represent all persons in the population, 14 years of age or over, residing in Canada, with the exception of residents of the Yukon and Northwest Territories, Indians living on reserves, inmates of institutions and members of the Armed Forces. Interviews are carried out in approximately 30,000 households chosen by area sampling methods across the country.†

\* Prepared in the Labour Division, Statistics Canada.

† A comprehensive description of the survey is given in Statistics Canada publication *Canadian Labour Force Survey (Methodology)* (Catalogue No. 71-504).

In the labour force survey, persons are classified on the basis of their activity during the week prior to the survey interview week. This week is called the reference week. The main divisions in the classification are:—

**Labour Force.**—The civilian labour force is composed of that portion of the civilian non-institutional population, 14 years of age or over who, during the reference week, were employed or unemployed.

**Employed.**—The employed include all persons who, during the reference week: (a) did any work for pay or profit; (b) did any work which contributed to the running of a farm or business operated by a related member of the household; (c) had a job, but were not at work, because of bad weather, illness, industrial dispute or vacation, or because they were taking time off for other reasons. Persons who had jobs but did not work during the reference week and who also looked for work are included in the unemployed as persons without work and seeking work.

**Unemployed.**—The unemployed include all persons who, through the reference week: (a) were without work and seeking work, i.e., did not work during the reference week and were looking for work, or would have been looking for work except that they were temporarily ill, were on indefinite or prolonged layoff, or believed no suitable work was available in the community; (b) were temporarily laid off for the full week, i.e., were waiting to be called back to a job from which they had been laid off for less than 30 days.

**Not in the Labour Force.**—Those not in the labour force include all civilians 14 years of age or over (exclusive of institutional population) who are not classified as employed or unemployed. This category includes those: going to school; keeping house; too old or otherwise unable to work; and voluntarily idle or retired. Housewives, students and others who worked part-time are classified as employed or, if they looked for work, as unemployed.

The estimates derived from the labour force survey, which are based on a sample of households, are subject to sampling error. Somewhat different figures might be obtained if a complete census were taken and this difference is called the sampling error of the estimates. In the design and processing of the labour force survey, extensive efforts are made to minimize the sampling error; in general, the percentage of error tends to decrease as the size of the estimate increases. A statistical measure of the sampling error is given in Statistics Canada monthly publication *The Labour Force* (Catalogue No. 71-001).

**The Labour Force, 1960-70.**—During the 1960s, the Canadian labour force expanded very rapidly, increasing by 1,963,000 or 30.6 p.c. During the 1960-70 period, the number of women in the labour force increased by 1,033,000 or 62.3 p.c., an advance that was greater, both absolutely and relatively, than the increase of 930,000 or 19.6 p.c. experienced by men. The total participation rate (the labour force as a percentage of the population) reached a record high level in 1970 of 55.8 compared with 54.2 in 1960. This occurred despite the continued decline of the male participation rate which reached a record low of 76.4 compared with 80.7 in 1960; the female rate rose from 27.9 to 35.5 in the same comparison. The total labour force, employed and unemployed, by sex, for 1960 and 1970 is shown in the chart on the facing page and changes in employment by region and by industry during the period are shown on page 836.

Table 1 shows that the total number of persons employed in Canada rose from 5,965,000 in 1960 to 7,879,000 in 1970, an increase that was shared by all regions of the country; employment in the Atlantic region rose by 23.8 p.c., in Quebec 30.8 p.c., in Ontario 33.2 p.c., in the Prairie region 23.5 p.c., and in British Columbia 57.0 p.c. The percentage distribution of the labour force, by sex, is shown in Table 2.

Table 3 shows the changes over the decade in the distribution of employment by industry. Noteworthy was the tremendous growth in the service industries' share of total employment, which rose from 25.3 p.c. in 1961 (1960 data not available) to 31.9 p.c. in 1970. This growth was confirmed by the occupation data given in Table 4, which shows that the proportion of professional and technical employed rose from 9.9 p.c. to 13.6 p.c. and service and recreation employed from 10.9 p.c. to 12.3 p.c. during the period.

Tables 1 and 5 provide a clear indication of the changing patterns of unemployment over the 1960-70 period, indicating the fall in the first half of the 1960s and the rise in the second half which reached a peak in 1970.

### CHANGE IN EMPLOYMENT BY REGION AND BY INDUSTRY BETWEEN 1960\* AND 1970

\* INDUSTRY COMPARISON IS BETWEEN 1961 AND 1970; 1960 DATA IS NOT AVAILABLE.

## Section 3.—Employment Statistics\*

### Subsection 1.—Statistics of Employment, Earnings and Hours

Monthly records of employment have been collected from larger business establishments since 1921. At that time a survey was instituted to provide employment index numbers which would serve as current economic indicators. In 1941 the survey was extended to provide information on payrolls and per capita wages and salaries and in 1944 it was further extended to provide data on hours of work and hourly and weekly wages. Also during the war period, separate records for men and women employees were established. Beginning with the January 1966 issues of *Employment and Average Weekly Wages and Salaries* and *Man-Hours and Hourly Earnings*, the data compiled are on a revised basis. A historical series (Catalogue No. 72-504) provides, on the revised basis, monthly and annual data from 1961-65. The revision has involved the publishing of employment indexes on the time base 1961 = 100 in place of the time base 1949 = 100. All data are compiled on the 1960 standard industrial classification.

The survey now covers sectors of the following major industry divisions: forestry; mining (including milling); manufacturing; construction; transportation, communication and other utilities; trade; and finance, insurance and real estate. Also included are certain branches of the service industry, mainly hotels and restaurants, laundries and dry-cleaning plants, and recreational and business services. The survey excludes agriculture, public

\* Prepared in the Employment Section, Labour Division, Statistics Canada.

administration and community services such as health and education. The coverage corresponds closely, therefore, to the business sector of the economy. Since the survey covers only firms employing 20 or more persons in any month of the year and excludes several industries, the employment records are published in the form of index numbers.

The monthly employment statistics relate to the number of employees drawing pay in the last pay period in the month. Data are requested for all classes of employees with the exception of homeworkers and casual employees working less than one day in the pay period. Owners and firm members are also excluded. The respondents report the gross wages and salaries paid in the last pay period in the month, before deductions are made for income tax, unemployment insurance, etc. The reported payrolls represent gross remuneration for services rendered and paid absences in the period specified, including salaries, commissions, piece-work and time-work payments, and such items as shift premiums and regularly paid production, and incentive and cost-of-living bonuses. The statistics on hours relate to the straight and overtime hours worked by those wage-earners for whom records of hours are maintained, and also to hours credited to wage-earners absent on paid leave during the reported period. If the reported period exceeds one week, the payroll and hours data are reduced to weekly equivalents.

**Employment.**—Table 6 shows that, over the 1966-70 period, the industrial composite index of employment rose by 5.3 p.c. Each sector except forestry, construction and manufacturing contributed to the increase; service advanced by 28.3 p.c., finance, insurance and real estate by 19.2 p.c., trade by 14.2 p.c., mining by 8.1 p.c. and transportation, communication and other utilities by 4.7 p.c. The declines in forestry, construction and manufacturing amounted to 20.7 p.c., 11.6 p.c. and 0.6 p.c., respectively. Compared with 1969, the 1970 composite index was up 0.2 p.c.

Statistics Canada staff at work on 1971 Census forms. Although highly sophisticated computers are used to tabulate detailed returns, the services of 4,000 clerks were required for varying periods of time, some for three years. All 1971 Census publications will be published by May 1974.

### 6.—Annual Average Index Numbers of Employment, by Industrial Division, 1966-70, and Monthly Indexes 1970 and 1971

NOTE.—These indexes are calculated as at the last pay period of each month, on the base 1961=100.

**Weekly Wages and Salaries.**—Average weekly wages and salaries have increased substantially in the years for which current payroll statistics have been collected, rising from \$23.44 in 1939 to \$96.30 in 1966 and \$126.82 in 1970. The upward movement gained momentum after the end of the War and average annual increases from 1946 to 1952 were more than double those between 1939 and 1946. After 1952 the rate of increase, in terms of year-to-year percentage changes, fell slightly, particularly between 1959 and 1962 when average earnings rose about 3 p.c. per annum. In the following years the rate increased moderately—earnings in 1969 were 7.1 p.c. higher than in 1968 and in 1970 they were 7.8 p.c. higher than in 1969.

### 10.—Annual Index Numbers of Employment and Average Weekly Wages and Salaries, by Industry, Province and Urban Area, 1968-70

Industry	Employment (1961=100)			Average Weekly Wages and Salaries

<sup>1</sup> Mainly hotels, restaurants, laundries, dry-cleaning establishments and recreational and business services.

**Hours and Earnings of Hourly Rated Wage-Earners.**—The monthly survey of employment and payrolls covers statistics of hours of work and paid absence of those wage-earners for whom records of hours are maintained, together with the corresponding totals of gross wages paid. These wage-earners are mainly hourly rated production workers; information on hours is frequently not kept by employers for ancillary workers nor, in many industries and establishments, for any wage-earners. Salaried employees are excluded by definition from the series. As a result of these exclusions, data are available for fewer industries and workers than are covered in the employment and average weekly wage and salary statistics.

During the period 1966-70, there was a slight decline in average weekly hours but average hourly and weekly wages rose substantially. For the most part, upward wage-rate revisions in all industries were responsible for the increases. Technological changes, which in many cases involve the employment of more highly skilled workers at the expense of those in the lower-paid occupations, also contributed to the advance of average hourly earnings. From 1966 to 1970, average weekly wages rose 30.6 p.c. in manufacturing, 38.6 p.c. in mining and 39.8 p.c. in construction. Average hourly earnings increased by 33.8 p.c. in manufacturing, 42.7 p.c. in mining and 50.4 p.c. in construction. In 1970, average hourly earnings in manufacturing rose 7.9 p.c., in mining 13.1 p.c. and in construction 13.5 p.c. over the 1969 levels.

**Subsection 2.—Earnings and Hours of Work in Manufacturing\***

Since 1946 an annual survey of earnings and hours of work in manufacturing has been conducted using (since 1948) the last week of October as the survey week. Information is collected during this normal or representative working week of the year, following generally the same concepts, definitions and coverage as in the larger establishment monthly employment survey. If strikes or other unusual working conditions distort the norm for this week, a more suitable week is substituted. Over the whole period, earnings and hours of work in manufacturing have been reported by sex and category and, since 1951, figures have been available for clerical and related workers as distinct from other salaried employees. In addition, the distribution of employees by weekly earnings has been collected periodically since 1950 and the distribution of wage-earners by hours worked or paid for was collected each year from 1946 to 1949 and periodically thereafter.

Tables 14 and 15 give figures for 1963-69. It should be noted that in 1963 there was a break in continuity with previous years. The new establishment concept introduced in 1961 drew into the manufacturing universe some activity reports, such as sales branches, which formerly reported to other industries; these are now coded to manufacturing when they form part of an establishment, the principal activity of which is manufacturing. The survey was not carried out in 1961 and 1962 and revised figures are available only from 1963. The 1960 standard industrial classification is used in Tables 16 and 17.

\* More detailed information is given in Statistics Canada annual report *Earnings and Hours of Work in Manufacturing* (Catalogue No. 72-204).

### 14.—Average Earnings of Male and Female Employees in Manufacturing, Survey Week 1963-69, and Percentage Increases over Previous Year

NOTE.—Survey week is the last week of October. This survey was not conducted in 1961 and 1962 (see p. 845).

<sup>1</sup> The durable group includes wood products, furniture and fixtures, primary metal industries, metal fabricating industries, machinery (except electrical), transportation equipment, electrical products and non-metallic mineral products; the non-durable group includes all other manufacturing industries.

## Subsection 3.—Estimates of Employment\*

Estimates of employees by province and industry are produced by adding together data from the long-standing employment and earnings survey of larger establishments, from a sample survey of smaller establishments, and from special surveys in the non-commercial sector. These estimates are available from 1961 on a monthly basis.

The estimates of employees are more reliable indicators of changes in total employment than the large-establishment employment indexes released in the publication *Employment and Average Weekly Wages and Salaries*. However, the design of the sample survey does not permit the publication of extensive geographic and industrial detail and the large-establishment employment indexes are the only source of current information of this type.

\* More detailed information is given in Statistics Canada monthly publication *Estimates of Employees by Province and Industry* (Catalogue No. 72-008).

## 18.—Estimates of Numbers of Employees, by Industrial Division, 1966-70 and by Month 1970

### Subsection 4.—Estimates of Labour Income\*

Labour income, as shown in Table 19, is the compensation paid to employees for services rendered either as wages and salaries or as supplementary labour income. Wages and salaries include directors' fees, bonuses, commissions, taxable allowances and benefits, some imputed earnings (e.g., those for persons in religious orders) and living allowances considered to be an additional benefit to the employee. Supplementary labour income, which consists of payments made by employers for the future benefit of employees, is composed of employers' contributions to employee welfare and pension funds, to the Workmen's Compensation Fund and to the Unemployment Insurance Fund.

\* More detailed information is given in Statistics Canada publication *Estimates of Labour Income* (Catalogue No. 72-005).

### 19.—Wages and Salaries, by Industry, and Supplementary Labour Income, 1966-70, and by Month 1970 and 1971

NOTE.—Based on the 1960 standard industrial classification. Figures are unadjusted for seasonal variation.  
(Millions of dollars)

<sup>1</sup> Excludes military pay and allowances.

<sup>2</sup> Includes fishing and trapping.

### Section 4.—Wage Rates, Hours of Labour and Other Working Conditions

Statistics on occupational wage rates by industry and locality, with standard weekly hours of labour, are compiled by the Canada Department of Labour and published in the annual report *Wage Rates, Salaries and Hours of Labour*. The statistics are based on an annual survey covering some 38,000 establishments in most industries and apply to the last normal pay period preceding Oct. 1. Average wage rates of time workers and average straight-time earnings of piece workers and other incentive workers for selected occupations are shown separately in the report but are combined in the calculation of industry index numbers shown in Table 20. Predominant ranges of rates for each occupation used are also given; overtime pay is excluded.

The index numbers of Table 20 measure changes in wage rates for non-office employees below the rank of foreman. They do not, however, provide a basis for comparing the level of wages in one industry with that in another. Information on concepts and methods of developing these statistics is given in the annual report.

**20.—Index Numbers of Average Wage Rates for Certain Main Industrial Groups, 1961-70**

(1961=100)

NOTE.—Figures for years prior to 1961 are not available on the 1961 base; indexes for 1956-65 on the 1949 base are given in the 1967 Year Book at p. 763 and indexes back to 1901 on the same base appear in the Canada Department of Labour publication *Wage Rates, Salaries and Hours of Labour 1965*.

<sup>1</sup> "Other Industries" consists of logging; mining; transportation (all sectors including air transportation); storage and communication (including radio and TV); public utilities; trade; finance; and government and personal service.

Table 22 gives summary data on working conditions of plant and office employees in manufacturing industries and all industries for the years 1968-70. The percentages in this table denote the proportions that employees—plant or office—of establishments reporting specific items bear to the total number of all such employees in all establishments replying to the survey; they are not necessarily the proportions of employees actually covered by the various items. Further details and additional information are given in the annual report *Working Conditions in Canadian Industry*, compiled and published by the Canada Department of Labour and based on a survey at May 1 each year of some 38,000 reporting units.

**Wages of Farm Labour.**—The information on farm wages is provided by volunteer farm correspondents located in all provinces except Newfoundland. The rates presented in Table 23 are average wages paid to all farm help regardless of age and skill. Because the rates reported may cover a wide range of skills, of types of work and of ages of hired workers, the value of the resulting data is considered to be an indicator of trends rather than a measure of absolute wage levels.

### Section 5.—Pension Plans\*

Very few pension plans in Canada have been in existence for more than 25 years and most of the older plans were established by governments, banks and railways. The greatest growth in pension plans and coverage began during World War II and continued through the postwar years. In 1960 there were 9,000 pension plans in Canada covering some

\* Prepared by the Pension Section, Labour Division, Statistics Canada.

1,800,000 persons and by 1970 the number of plans, exclusive of the public service superannuation funds of the Federal Government and of six provincial governments, had increased to an estimated 18,335 covering some 2,486,000 persons.

Up to 1948, most plans were of the insured type, being underwritten by either an insurance company or the Government Annuities Branch of the Canada Department of Labour. The trust fund arrangement then began to grow in popularity and is now the dominant instrument for funding pension benefits measured in terms of membership and assets held. In 1970, contributions to trustee pension funds alone amounted to \$1,054,000,000, accounting for over 75 p.c. of all contributions to private pension plans excluding government plans having no invested assets. Funds of this magnitude represent a major medium for personal savings and the investment of these funds exerts a considerable influence on the capital market.

Table 24 shows the distribution of pension business for the years 1966-70, excluding the public service superannuation funds of the Federal Government and of six provincial governments which are nominal funds only, having no invested assets.

Most trustee pension plans use the facilities of corporate trustees (trust companies) who invest the contributions, accumulate the earnings and pay benefits to the plan members. Trustee pension plan funds are also managed by individual trustees or pension fund societies. The designated trustee, corporate or individual, must invest the contributions in accordance with the trust agreement which sets forth the rights and duties of the trustee. Many of the small funds invest in the "pooled funds" of trust companies which combine the assets of many pension funds, thus providing the diversification of investments usually available only to larger funds.

**Federal Government Annuities.**—Since 1908 the Federal Government has sold annuities and industrial pension plans under the Government Annuities Act (RSC 1970, c. G-6). The purpose of the introduction of this legislation was to encourage people to save for old age but since the need for government service in this form has decreased in recent years, reduction of the program became justified and the employment of salesmen to solicit business was ended on Nov. 30, 1967. Annuities are still available under the Act to those who ask for them. They are now administered by the Unemployment Insurance Commission.

## Section 6.—Unemployment Insurance\*

Unemployment insurance has been part of Canada's social and economic life since the Unemployment Insurance Act was passed in 1940. Since that time the basic structure of the Act has remained unaltered. Various amendments have brought new categories of workers into the plan and contributions and benefit rates have been raised periodically to keep abreast of changing economic conditions.

In 1968, when Parliament approved upward revisions of both contributions and benefit rates and broadened the scope of coverage, the Unemployment Insurance Commission was instructed to carry out a full-scale investigation of that program and to recommend appropriate changes in philosophy and structure. The Unemployment Insurance Act, 1971, effective June 27, 1971, was the result of extensive studies, the basic objectives being (a) to provide assistance to cope with the contingency of an interruption of earnings resulting from unemployment, including unemployment from illness, and (b) to co-operate with other agencies engaged in social development.

Under the Unemployment Insurance Act, 1971, coverage is universal for all regular members of the labour force for whom there exists an employer-employee relationship. There is only one measure of inconsiderable employment, i.e., less than \$30 per week or 20 times the provincial hourly minimum wage, whichever is the lesser. Universality becomes effective Jan. 2, 1972. Coverage, contributions and benefit entitlement cease at age 70.

Employers and employees absorb the benefit cost for initial benefits as well as the administration cost, with the employer rate being 1.4 times the employee rate. The government share is confined to the benefit cost for extended benefits as well as the excess cost of initial benefits that are due to a national unemployment rate greater than 4 p.c. There is no fund and employer and employee contributions are adjusted yearly. Department of National Revenue/Taxation commences collection of the contributions effective Jan. 2, 1972. Persons formerly not contributing either because of their occupation or by virtue of being over the salary ceiling will pay a preferred rate for the first three years. For those who had been occupationally excluded, the preferred rate is portable. However, in the case of persons formerly excluded because of the salary ceiling, the preferred rate continues only as long as the employee remains with the Jan. 2, 1972 employer. An experience rating formula for employers may be introduced in 1974 to reflect the additional benefit expense generated by large employers who have above-average layoff experience.

The duration of benefit under the new program is not determined solely by the length of attachment to the labour market. A claimant can draw to a maximum of 51 weeks depending on his employment history and prevailing economic conditions, provided (a) he has at least eight weeks of contributions in the last 52 and (b) he meets the conditions of availability, capability and searching for work. Persons with 20 or more weeks of insured earnings (major labour force attachment) are eligible for a wider range of benefit that includes a pre-payment of three weeks of regular benefit for work-shortage lay-offs; benefit payments when the interruption of earnings was caused by illness or pregnancy; and three weeks retirement benefit for older workers.

Sickness benefit is available for a maximum of 15 weeks for persons with major labour force attachment who have suffered an interruption of earnings due to illness, injury or quarantine (excluding workmen's compensation). If a person is taken ill while on regular claim, sickness benefit is available but the combined duration of benefits during the initial benefit period cannot exceed 15 weeks.

Maternity benefit is available for eight weeks before confinement, the week of confinement and six weeks after, to women who have had a major labour force attachment. They must also have been attached to the labour force at least 10 of the 20 weeks prior to the 30th week before the expected date of confinement.

Retirement benefit is available for three weeks. It is paid in a lump sum to claimants with a major labour force attachment who are 65-70 and who have signified they have left

\* Prepared by the Unemployment Insurance and Manpower Section, Labour Division, Statistics Canada; statistics of unemployment insurance are compiled and published by Statistics Canada from material supplied by the Unemployment Insurance Commission.

the labour force by having applied for Canada Pension Plan or the Quebec Pension Plan; and to persons over 70 years of age. In the case of those over 70, the application must be within 32 weeks of the 70th birthday as employment weeks are no longer earned after that time. The benefit is paid without a waiting period and without regard to earnings or availability.

The benefit rate for all claims will be two thirds of average insured earnings in the qualifying period to a maximum of \$100 per week and with a floor of \$20 per week. For claimants with dependants and whose average qualifying earnings are \$50 per week or less, the benefit rate is 75 p.c. During later stages of benefit all claimants with dependants draw benefit at 75 p.c. of qualifying earnings subject to the \$100 maximum.

Work-related income in excess of 25 p.c. of benefit rate is deducted. In the case of sickness and maternity, proceeds of wage loss policies are not deducted during the waiting period but are deducted after the waiting period. All work-related income is deducted during both the waiting period and after the waiting period has been served.

Because the statistics in Tables 26 to 30 refer to the former Unemployment Insurance Act, an explanation of the program under that Act follows.

The Unemployment Insurance Act, 1955 applies to all persons employed under a contract of service except: the Canadian Armed Forces; the permanent public service of the Federal Government; provincial government employees except where insured with the concurrence of the government of the province; certified permanent employees of municipal or public authorities; persons engaged in hunting and trapping, private domestic service, private-duty nursing, and teaching; workers on other than an hourly, daily or piece rate earning more than \$7,800 a year effective June 30, 1968, unless they elect to continue as insured persons; employees in a charitable institution or in a hospital not carried on for purpose of gain except where the institution or hospital consents to insure certain groups or classes of persons with the concurrence of the Commission. All persons paid by the hour, day, or at a piece rate (including a mileage rate) are insured regardless of amount of earnings.

The amount of the employee contribution is determined by the employee's weekly earnings; an equal contribution is required from the employer. The Federal Government contributes one fifth of the aggregate employer-employee contribution and defrays administrative expenses. Contributions became payable on July 1, 1941. Benefit became payable on Jan. 27, 1942 and by Mar. 31, 1970 a total of \$6,804,000,000 had been paid.

The following statement shows the current weekly rates of contribution and benefit effective June 30, 1968. The weekly contribution is based on actual earnings in the week, irrespective of the number of days worked. The benefit rates are calculated on the average weekly contributions for the last 30 weeks in the 104 weeks preceding claim. In order to qualify for regular benefit, a claimant must have at least 30 weekly contributions in the last 104 weeks prior to claim, eight weekly contributions since the start of the last preceding regular benefit period or in the last year prior to claim, whichever is the shorter period, and 24 weekly contributions since the start of the last preceding benefit period, or in the year prior to the claim, whichever is the longer period. Weekly rates of contribution and benefit under the Unemployment Insurance Act, in effect from June 30, 1968, were:—

Range of Weekly Earnings	Weekly Employee Contribution	Range of Average Weekly Contributions	Weekly Rates of Benefit		Earnings not Deducted	
			Person Without Dependant	Person With Dependant	Person Without Dependant	Person With Dependant
	cts.	cts.	\$	\$	\$	\$

The Act contains a special provision whereby the regular contribution requirements are relaxed somewhat during a 5½-month period commencing with the first week of December each year. Under this provision, claimants unable to fulfil the contribution requirements for regular benefit may draw "seasonal benefit" if they have at least 15 contribution weeks during the fiscal year, or, failing this, if they terminated regular benefit since the previous mid-May.

*Statistics on the Operation of the Act.*—In order to assess the impact of changing economic conditions on the insurance program, provision is made for collection of current operational data, such as claims filed and processed and payments made. This information is published monthly in the *Statistical Report on the Operation of the Unemployment Insurance Act* (Catalogue No. 73-001). Current claims and payment data are useful for administrative purposes and are also a source of information to the public regarding financial and other aspects of the program.

Persons wishing to draw benefit must file either an initial or a renewal claim. Where it is necessary to compute entitlement to benefit, an initial claim is taken, otherwise a renewal. In the main, initial and renewal claims combined are an approximation of recorded separations from employment during a month. However, if a claimant exhausts his benefit and wishes to be reconsidered for further benefit, an initial claim is required. Such claims, accounting for approximately 20 p.c. of the monthly volume in 1970, are not new cases of unemployment. The count of claimants at the month-end indicates the extent to which claimants maintain contact with local offices of the Commission.

<sup>1</sup> Month-end average.

In addition to the monthly data published on the operation of the Unemployment Insurance Act, annual tabulations are compiled regarding persons employed in insurable employment and benefit periods established and terminated. These data are published in the annual report *Benefit Periods Established and Terminated under the Unemployment Insurance Act* (Catalogue No. 73-201). Data on persons insured under the Act are obtained from a 5-p.c. sample of insurance books and contribution cards renewed at June 1 each year (10-p.c. sample prior to 1969). Included are persons engaged in insurable employment as well as persons on claim at that date.

<b>Totals.....</b>	<b>4,487,380</b>	<b>4,734,770</b>	<b>4,812,040</b>	<b>5,300,000</b>	<b>5,399,600</b>

*Benefit.*—The duration of regular benefit is related to the contribution history—one week's benefit for every two weeks' contributions in the past 104 weeks with a maximum of 52 weeks. However, contributions more than one year old cannot be used if they have already been taken into account in computing previous rights. Disqualifications for benefit include: loss of work owing to a labour dispute in which the contributor is participating or directly interested; unwillingness to accept suitable employment; being an inmate of any prison or any institution supported out of public funds; refusal to attend a course of instruction or training if directed to do so; residence outside Canada unless otherwise prescribed. Disqualification of a claimant for a period not exceeding six weeks may be imposed if an employee is discharged by reason of his own misconduct or leaves employment voluntarily without just cause or refuses suitable employment, or other specified reason.

Table 28 distributes regular benefit periods terminated by province and shows average weeks and average dollar benefit paid on these terminations. A claimant establishes a *regular benefit period* when he submits his claim in the prescribed manner and proves he has fulfilled the minimum contribution requirements. The duration of benefit and the weekly rate authorized, comprising total entitlement, are then calculated and the claimant's benefit may be drawn upon during successive intervals of unemployment. His benefit period terminates either when he has exhausted the amount authorized or when 52 weeks\* have elapsed since he established, whichever comes first.

\* Under the Training Allowances Act, 1966, the benefit period of an insured person may be extended if he (or she) is in receipt of a training allowance. The benefit period is extended by the amount of time the person is undergoing training but in no event can the benefit period extend beyond 156 weeks.

## Section 7.—Employment Injuries and Workmen's Compensation

**Fatal Employment Injuries.**—Data on fatal employment injuries, compiled by the Canada Department of Labour, are obtained from provincial workmen's compensation boards, the Canadian Transport Commission, other government authorities and press reports. Of the 957 fatal injuries to industrial workers that occurred during 1970, 232 were caused by collisions, derailments or wrecks, 195 were the result of falls and slips and 197 resulted from a person being struck by an object. The act of being caught in, on or between objects, vehicles, etc., accounted for 97 deaths, while inhalations, contact, absorptions, ingestions and industrial diseases claimed 82 lives. There were 50 deaths caused by contact with electric current, 43 by conflagrations, temperature extremes and explosions, 16 by over-exertion and two by striking against or stepping on objects. The remaining 43 were the result of various miscellaneous accidents.

<sup>1</sup> Injuries requiring medical treatment but not causing disability for a sufficient period to qualify for compensation; the period varies among provinces.

<sup>2</sup> Includes, except where noted otherwise, payments to compensate loss of earnings, medical aid payments, cost of rehabilitation and hospitalization (not including capital expenditures) and pensions paid (not pensions awarded) for temporary and permanent disabilities; the Quebec compensation figure includes pensions awarded as well as pensions paid.

<sup>3</sup> Excludes payments by employers who make direct compensation to their employees; such employees come under Schedule II of the Ontario and Quebec Workmen's Compensation Acts.

<sup>4</sup> Estimated from combined figures of 131,866 in 1969 and 134,284 in 1970 for temporary disability and permanent disability claims.

## Section 8.—Organized Labour

### Subsection 1.—Union Membership

At Jan. 1, 1971, labour unions reported a total of 2,210,554 members in Canada, an increase of 1.7 p.c. over 1970. During the same period the number of non-agricultural paid workers in Canada increased by 2.7 p.c. and the entire labour force by 4.4 p.c. Union members thus comprised, in 1971, 33.3 p.c. of the non-agricultural paid workers and 26.5 p.c. of the total civilian labour force, compared with 33.6 p.c. and 27.2 p.c., respectively, in 1970.

Canadian Labour Congress (CLC) affiliates, with 1,654,147 members reported, accounted for 74.8 p.c. of total union membership in Canada, compared with 75.1 p.c. in 1970. Of the total in CLC affiliates in 1971, 1,147,441 members were in unions that were also affiliated with the American Federation of Labor (AFL) and Congress of Industrial Organizations (CIO) in the United States; membership of unions affiliated with the CLC but not holding affiliation with the AFL-CIO totalled 506,706, or 22.9 p.c. of the total.

Another 9.6 p.c. of total membership of unions in Canada, 212,065 members, belonged to federations affiliated with the Quebec-based Confederation of National Trade Unions (CNTU), and the remaining 15.6 p.c. belonged to various unaffiliated international and national unions and independent local organizations.

#### 34.—Union Membership, by Type of Union and Affiliation, as at January 1971

Type and Affiliation	Unions	Locals	Member-ship
	No.	No.	No.
<b>International Unions.....</b>	<b>99</b>	<b>4,891</b>	<b>1,371,109</b>
AFL-CIO/CLC.....	85	4,441	1,147,441
CLC only.....	4	141	122,533
AFL-CIO only.....	4	8	531
Unaffiliated unions.....	6	301	100,604
<b>National Unions.....</b>	<b>65</b>	<b>4,899</b>	<b>771,177</b>
CLC.....	19	2,804	372,090
CNTU.....	12	1,106	211,143
Unaffiliated unions.....	34	989	187,944
<b>Directly Chartered Local Unions.....</b>	<b>137</b>	<b>137</b>	<b>13,005</b>
CLC.....	134	134	12,083
CNTU.....	3	3	922
<b>Independent Local Organizations.....</b>	<b>129</b>	<b>129</b>	<b>55,263</b>
<b>Grand Totals.....</b>	<b>430</b>	<b>10,056</b>	<b>2,210,554</b>

International unions with headquarters in the United States accounted for 62.0 p.c. of the 1971 membership, compared with 62.5 p.c. in 1970; national and regional unions, which charter locals in Canada only, made up 34.9 p.c. (34.6 p.c. in 1970). Independent local organizations and local unions chartered by the two central labour congresses, the CLC and the CNTU, accounted for the remaining 3.1 p.c. (2.8 p.c. in 1970).

In 1971, 20 unions (as compared with 19 in 1970) reported membership of 30,000 or more. Nine unions reported 50,000 or more members and these accounted for 37.0 p.c. of the total. The largest union, in terms of membership in Canada, was again the Steelworkers (AFL-CIO/CLC) with 156,000 members. Next in size were two national affiliates of the CLC—the Canadian Union of Public Employees with 138,088 members and the Public Service Alliance of Canada with 121,571. A list of the unions reporting 50,000 or more members in 1971 follows.

<i>Relative Position in 1971</i>	<i>Union and Affiliation</i>	<i>1971 Membership</i>	<i>Relative Position in 1970</i>
1	United Steelworkers of America (AFL-CIO/CLC).....	156,000	1
2	Canadian Union of Public Employees (CLC).....	138,088	2
3	Public Service Alliance of Canada (CLC).....	121,571	3
4	International Union, United Automobile, Aerospace and Agricultural Implement Workers of America (CLC)....	111,219	4
5	United Brotherhood of Carpenters and Joiners of America (AFL-CIO/CLC).....	74,645	5
6	International Brotherhood of Teamsters, Chauffeurs, Ware- housemen and Helpers of America (Ind.).....	58,918	6
7	International Brotherhood of Electrical Workers (AFL- CIO/CLC).....	55,000	7
8	Service Employees' National Federation, Inc. (CNTU)....	52,307	9
9	International Association of Machinists and Aerospace Wor- kers (AFL-CIO/CLC).....	51,136	8

Further details on the labour movement in Canada, including lists of individual unions, their membership, principal officers and the geographic distribution of their locals, is carried in *Labour Organizations in Canada*, an annual publication of the Canada Department of Labour; it is available from Information Canada, Ottawa.

### Subsection 2.—Wage Developments under Major Collective Agreements, 1970

The Canada Department of Labour publishes wage settlements data for collective agreements on a quarterly basis. The agreements covered are limited to negotiating units of 500 or more employees in all industries, with the exception of construction. The base rate for a negotiating unit is defined as the lowest rate of pay, expressed in hourly terms, for the lowest paid classification used for qualified workers in the bargaining unit. In most cases, the base rate represents pay for an unskilled or semi-skilled classification of workers. However, this is not so in contracts covering only skilled and/or professional workers. The wage data, therefore, are not necessarily representative of the average increases enjoyed by the workers in the negotiating unit as a whole. Nevertheless, the data on numbers of agreements and workers refer to all occupational groups in the negotiating unit.

Wage rate data given in Tables 35 and 36 indicate that on Dec. 31, 1970, approximately 1,476,700 workers were covered by 686 collective agreements in negotiating units of 500 or more workers in all industries except construction. The average base rate rose 19.1 cents, or 7.4 p.c., during the 12-month period ended Dec. 31, 1970, compared with an increase of 16.9 cents or 7.1 p.c. during the preceding 12-month period. On a year-over-year basis, the consumer price index rose by 1.5 p.c., comparing December 1970 with December

1968, and by 4.6 p.c. comparing December 1969 with December 1968. When the wage increases are deflated by the consumer price index increase, the average base rate increased, in real terms, 5.8 p.c. in 1970 and 2.4 p.c. in 1969.

**35.—Employees Covered by All Collective Agreements for Negotiating Units with 500 or More Employees in All Industries other than Construction, as at Dec. 31, 1970<sup>1</sup>**

Region or Province	Manufacturing Industries			Non-manufacturing Industries	All Industries except Construction

<b>Canada.....</b>	<b>268,145</b>	<b>200,835</b>	<b>468,980</b>	<b>1,007,680</b>	<b>1,476,660</b>

<sup>1</sup> All agreements "in force", irrespective of the year of settlement; as at Dec. 31, 1970, this universe included 686 agreements covering 1,476,660 employees.

<sup>2</sup> Agreements pertaining to workers located in more than one province and one agreement pertaining to the Northwest Territories.

Additional data are available from the Canada Department of Labour on wage settlements for agreements settled during quarterly periods, including number of agreements settled, number of employees covered and duration of contracts. The agreements covered are again limited to negotiating units of 500 or more employees in all industries except construction. Details are not given here but, for 1970 as a whole, 302 contracts, affecting the wage rates of about 579,100 workers, were settled. On the average, the 302 settlements provided an annual percentage increase in base rate equal to 8.8 p.c. simple or 8.4 p.c. compound, over the term of the contracts. The comparable percentage for 1969 was 8.0 p.c. simple or 7.6 p.c. compound.

During 1970, settlements of one-year duration produced increases averaging 9.1 p.c.; those of two-year duration of 10.0 p.c. and 7.4 p.c. for the first and second years, respectively; and those of three-year duration of 10.2 p.c., 7.0 p.c. and 4.4 p.c. for the first, second and third years of the contract. These increases compare with those of 1969 as follows: one-year agreements, average increases of 8.0 p.c.; two-year agreements, average increases of 9.4 p.c. and 5.7 p.c.; and three-year agreements, average increases of 10.7 p.c., 6.6 p.c. and 5.2 p.c. for the first, second and third years, respectively, of the contract.

### 36.—Annual Percentage and Cents-Per-Hour Increases in Base-Rates under Major Collective Agreements, by Month, 1970

NOTE.—Based on all major collective agreements covering 500 or more employees in force except those in the construction industry. Data refer to rates actually paid in the month specified; no adjustments have been made for retroactive wage increases.

## Section 9.—Strikes and Lockouts

Statistical information on strikes and lockouts in Canada is compiled by the Economics and Research Branch of the Canada Department of Labour on the basis of reports from Canada Manpower Centres of the Department of Manpower and Immigration and provincial departments of labour. Table 37 covers strikes and lockouts which involve five or more workers and amount to 10 or more man-days. The developments leading to work stoppages are often too complex to make it practicable to distinguish statistically between strikes on the one hand and lockouts on the other. However, a work stoppage that is clearly a lockout is not often encountered.

The number of workers involved includes all workers reported on strike or locked out, whether or not they all belonged to the unions directly involved in the disputes leading to work stoppages. Workers indirectly affected, such as those laid off as a result of a work stoppage, are not included. Duration of strikes and lockouts in terms of man-days is calculated by multiplying the number of workers involved in each work stoppage by the number of working days the stoppage was in progress. The data on duration of work stoppages in man-days are provided to facilitate comparison of work stoppages in terms of a common denominator. They are not intended as a measure of the loss of productive time to the economy.

## 37.—Strikes and Lockouts, by Industry, 1970 with Totals for 1966-70

*The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.*

The important role played by transportation in the history and economic development of Canada has been told often and well. The history of Canadian transportation may be divided into three distinct stages—the early or development stage lasting up to about 1920, the monopolistic stage from 1920 to about 1950, and the competitive stage beginning in the early 1950s.

The early settlers of Canada depended almost exclusively on transport by water. Long before Confederation, public works such as canals and docks were built by local governments for the purposes of defence and internal economic development. However, as the movement of goods and people became heavier, waterways and canals were found to be inadequate as transportation routes and the railway came into use. The first was opened in 1836 but the real railway boom began in the 1850s, and their construction or promised construction formed part of the Confederation scheme of 1867. The promised construction of the Intercolonial Railway from Central Canada to the Maritimes was written into the British North America Act of 1867. Similarly, one of the conditions under which British Columbia joined Confederation in 1871 was that the Dominion Government undertake the construction of a railway connecting it with the rest of the country and in 1874 work started on the construction of a transcontinental line. The successful completion of the Canadian Pacific Railway in 1885 marks the end of this part of Canadian railway history. By 1905, Canada was committed to the building of two additional transcontinental rail lines—the Canadian Northern and the Grand Trunk Pacific. The expectation that these railways would operate profitably proved ill-founded as both (as well as the Grand Trunk Railway Company) collapsed as privately owned enterprises. A Royal Commission in 1917 recommended that all three railways be consolidated with other government-owned railways; this proposal was accepted and the present Canadian National Railway System was founded. In the late eighteenth century Canada was one of the largest ship-owning

nations in the world. However, by 1900, because of stiff foreign competition and the advent of iron and steel ships, Canadian ocean shipping tonnage had decreased by nearly half.

The second period of Canadian transportation history, 1920-50, was characterized by the rapid development of different, competing modes of transport. The motor vehicle emerged as one of the dominant features and not only revolutionized the transportation industry but became indispensable to modern living; registrations increased nearly tenfold from 280,000 in 1920 to 2,400,000 in 1949. Air service for the conveyance of passengers, mail and freight started in 1924 and later in the 1920s flying services were in operation between major urban centres. In 1937 the Canadian Government established Trans-Canada Air Lines (now Air Canada) as a national airline which, by the end of that decade, operated regular passenger services between the largest cities of the country. Equally important in the field of civil aviation was the amalgamation of a number of independent airlines to form Canadian Pacific Airlines. At the same time during this period, Canadian international sea-borne shipping in Canadian vessels had been declining due partly to the depression and partly to competition from other nations. High wages, depreciation and heavy interest charges also had a depressing effect on Canadian shipping.

In the late 1920s, the Canadian Government attempted to rehabilitate and unify the various individual and often competing railway companies. Despite all these efforts the financial position of the railways deteriorated during the depression years and did not improve until the outbreak of World War II. During the war, railways assumed the main burden of carrying food, ammunition and troops. Railway passenger traffic reached its peak in 1944 when 60,000,000 passengers were carried and then began to decline with the increasing use of the automobile and bus for short or medium distances and of air carriers for medium and long distances.

Since the end of the Second World War, the transportation field has become highly competitive. The growth of highway transport has been one of the most important developments. Its amazing growth may be traced directly to the great technical advances that have been made in the design and operating efficiency of motor vehicles and also to the development of secondary manufacturing industries, the decentralization of industry and the growth of metropolitan areas. Long-distance highway transport became important in the early 1950s and the construction of the Trans-Canada Highway in the following years gave a further direct impetus to the growth of the industry.

The St. Lawrence Seaway, opened 1959, has been of great economic benefit to Canada by permitting the low-cost movement of such bulk commodities as wheat, iron ore and coal. There has been some speculation that the Seaway might soon become obsolete due to technological progress currently taking place in transportation. There would seem to be little doubt that changes such as container ships, giant tankers, unit trains, etc., will certainly influence the future pattern of Seaway traffic.

Pipelines came rapidly into the picture following the discovery of vast petroleum and gas reserves in Western Canada in the late 1940s. By 1950, there were 1,400 miles of trunk pipeline in operation in Canada and just six years later the total was 5,807 miles. This mileage has grown into a vast network which is making possible the economical exploitation of Canada's tremendous resources of oil and gas. In the early 1950s resource developments and the building of defence projects in the Canadian North gave a great impetus to the growth of air freight but, more recently, the advance has been mainly in the area of inter-city operations.

The airlines' share of intercity passenger-mile traffic carried by public conveyances rose to 37 p.c. by 1968, a growth attributable to the demand for fast service and to the revolutionary technological developments that have occurred in this industry, mainly the development of the turbo prop and jet engines which permitted the use of larger and more efficient aircraft. During this period, Canada's two major airlines—Air Canada and Canadian Pacific (CP Air)—became world carriers, Air Canada ranking among the largest.

Automobiles now account for more than four fifths of all intercity passenger travel and this, together with the growth of travel by air, has had an adverse effect on intercity bus travel which has declined more than 50 p.c. since 1950. The railways, too, have lost traffic in the past 20 years, especially passenger traffic, for the same reason. Nevertheless, important advances have been made in the rail transport field, the most outstanding being, perhaps, their conversion to diesel power. Complex programs of plant and equipment modernization were undertaken and centralized traffic control devices, electrically controlled classification yards, piggybacks and unit trains were developed to fight the competition as well as to supply better service. It should be noted also that the railways are repeating in the Canadian North the essential services they performed in the early history of Canada when great isolated areas were being opened up to industry and development.

Thus, the Canadian transportation environment has changed fundamentally in the past 20 years and will keep changing as each mode of movement, in competition with the others, continues to take advantage of technological developments in its own area and continues to adapt to changing economic requirements.

## PART I.—RAIL TRANSPORT\*

The Canadian railway scene is dominated by two giant transcontinental systems, supplemented by a number of regional railways. The two largest railway companies control a wide variety of Canadian and international transport and communications services. The government-owned Canadian National Railway System is the country's largest public utility and operates the greatest length of trackage in Canada. It serves all ten provinces as well as the Great Slave Lake area of the Northwest Territories. In addition, it operates a highway transport service, a fleet of coastal steamships, a chain of large hotels and resorts, a telecommunications service, and a scheduled Canadian and international air service (see p. 921). The Canadian Pacific Railway Company is a joint-stock corporation operating a railway service in eight provinces. It is also a multi-transport organization, operating, in addition to its railways, a domestic truck network, a fleet of inland, coastal and ocean-going vessels, a chain of year-round and resort hotels, a telecommunications service, and a domestic and foreign airline service (see p. 922). The British Columbia Railway (formerly the Pacific Great Eastern Railway) operates over a 1,000-mile route from North Vancouver to Fort Nelson in northeastern British Columbia. The Northern Alberta Railway, jointly owned by CP and CN, serves the area north of Edmonton with a 900-mile system. Northern Ontario is served by the provincially owned Ontario Northland Railways with a 600-mile system stretching from North Bay to Moosonee, and by the privately owned Algoma Central Railway operating over 300 miles of line between Sault Ste. Marie and Hearst.

Of the total railway revenue recorded in Canada in 1970, Canadian National contributed 50.7 p.c. and Canadian Pacific 36.7 p.c. The Quebec North Shore and Labrador Railway, built primarily to transport ore and concentrates from the iron mines of the Schefferville and Wabush areas of Labrador and Quebec to water transportation facilities on the St. Lawrence River, accounted for 3.3 p.c. of the revenues. Other railways contributing 1 p.c. or more to the total revenue figure were the Pacific Great Eastern 1.8 p.c., the Ontario Northland 1.1 p.c. and the Chesapeake and Ohio 1.0 p.c.

Even though the railways have in recent years faced strong competition from highway and air transport for the movement of people and much of the commodity trade, they are still indispensable for carrying bulk commodities and thus are necessary to the development of natural resources located in isolated areas of this great country. Only the pipelines have competed with the railways in this respect by providing an economical means of transporting the products of the oil and gas fields for long distances overland, and it is altogether probable that pipelines for transporting solids will, before long, constitute additional competition.

\* The statistical data in this Part were revised in the Transportation and Public Utilities Division, Statistics Canada; more detailed information is given in the annual reports of the Division.

(It is interesting to note that Canadian Pacific is in the forefront of research in this field.) The rapid growth of containerization in recent years has made the integration of the services of railway, highway, shipping and other modes of transport of growing importance. However, the two major railways of Canada, with their multi-transport interests, are in an excellent position to face this and other trends appearing in the transportation industry. Canadian railways have evolved over the past 100 years from a position of virtual monopoly in the movement of goods and people by rail, through a highly competitive stage to the present system of co-operation and co-ordination with other modes of transport. The latter approach permits each mode of transport to concentrate on the particular function it can perform most efficiently, thus establishing the most effective and economical system of transportation services possible.

**Government Aid to Railways.**—In order that the private railways of Canada might be constructed in advance of settlement as colonization roads or through sparsely settled districts where little traffic was available, it was necessary for federal and provincial governments and even for municipalities to extend some form of assistance. The form of aid was usually a bonus of a fixed amount for each mile of railway constructed and, in the early days, grants of land were also made other than for right-of-way. As the country developed, objections to the land-grant method became increasingly apparent and aid was given more frequently in the form of a cash subsidy for each mile of line, a loan or a subscription to the shares of the railway. Guarantees of debenture issues came later and, since the formation of the Canadian National Railways, all debenture issues of that System, except those for rolling-stock, have been guaranteed by the Federal Government. During the era of railway expansion before 1918, provincial governments guaranteed the bonds of some railway lines that afterwards were incorporated in the Canadian National Railway System. These bonds as they mature or are called are paid off by the Canadian National Railways, in large measure through funds raised by the issue of new bonds with Federal Government guarantee. Railway bonds guaranteed by the Government of Canada at Dec. 31, 1971 amounted to \$816,275,500.

As discussed on p. 941, the National Transportation Act (RSC 1970, c. N-17), administered by the Canadian Transport Commission, expresses a national transportation policy for Canada aimed at the development of "an economic, efficient and adequate transportation system making the best use of all available modes of transportation at the lowest total cost". This law is intended to provide the railways with greater freedom to meet the competition with which they are faced and to develop as an integral part of today's complex transportation system.

Under the Act, the 1966 level of Federal Government rail subsidy of \$110,000,000 a year will decline by \$14,000,000 a year until it disappears at the end of 1974. The Crow's-nest Pass rates on grain and flour from Western Canada and the rates under the Maritime Freight Rates Act remain in force. The rates under the Maritime Freight Rates Act are subsidized under the provisions of that Act.

**Government Aid to Truckers.**—Effective July 15, 1969, the Atlantic Region Freight Assistance Act provided for federal assistance to truckers, similar to that provided to railways under the Maritime Freight Rates Act, in respect of the movement of goods from points within the Provinces of Nova Scotia, Prince Edward Island and New Brunswick, the Island of Newfoundland and that portion of the Province of Quebec south of the St. Lawrence River and east of Quebec Highway 23 to points in Canada outside of that territory. On Oct. 1, 1970, similar federal assistance was authorized in respect of movements via highway transport within that territory.

**Track Mileage.**—The first railway to be built in Canada—the Champlain and St. Lawrence Railroad between Laprairie and St. Johns (St. Jean), Que.—was officially opened for service on July 21, 1836. However, the first great period of railway construction did

not take place until the 1850s when the Grand Trunk and the Great Western Railways were built as well as numerous smaller lines. The building of the Intercolonial and the Canadian Pacific Railways contributed to another period of rapid expansion in the 1870s and 1880s and, in the last period of extensive railway building (1900-17), the Grand Trunk Pacific, National Transcontinental and Canadian Northern Railways were constructed. Little change has occurred in the total track mileage in Canada since the 1920s. There has been some recent construction, including the extension of the British Columbia Railway (formerly the Pacific Great Eastern Railway) to Fort Nelson, but new construction had been largely offset by the abandonment of unprofitable lines, at least up until 1969.

<sup>1</sup> Defined as a single track extending the entire distance between terminals, upon which the length of the road is based.

<sup>2</sup> Includes 190 miles of track of the Cartier Railway which began operations in 1963 but was not included in the statistics until 1967.

<sup>3</sup> Newfoundland included from 1950.

<sup>4</sup> Excludes joint track amounting to 74 miles in 1966, 143 miles in 1967, 140 miles in 1968, 141 miles in 1969 and 140 miles in 1970.

**Rolling-Stock.**—Table 2 shows the numbers of the various types of freight and passenger equipment in operation in 1969 and 1970 compared with 1960, revealing a generally downward trend prior to 1969 in all types except privately owned cars. The latter, which include cars owned by non-rail industrial firms such as oil, chemical and railway car leasing companies that furnish freight cars to, or on behalf of, any railway line, have increased greatly in number. The figures of rolling-stock in operation do not reflect the offsetting trend toward larger, more efficient cars and locomotives or the steady improvement in speed of movement facilitated by modernized handling and terminal services. Each year, hundreds of units, particularly freight cars, are converted and modified to make them suitable for specific types of traffic or are replaced by special-purpose equipment designed for distinctive hauling jobs. The average capacity of all freight cars was 58.2 tons in 1970 compared with 51.4 tons in 1960. Also, although the number of diesel-electric locomotives in service has remained fairly static over this period, it should be noted that an extensive program of power upgrading has been followed by the railway companies.

## 2.—Railway Rolling-Stock in Operation as at Dec. 31, 1960, 1969 and 1970

				Other.....	32	751	1,254

<sup>1</sup> Decrease in 1970 reflects conversion by one major railway of box-type auto cars to ordinary box cars.

**Traffic, Employment and Finance Statistics.**—Statistics presented under this heading are for the Canadian National Railways, the Canadian Pacific Railway Company and 22 other common carrier lines whose gross revenues are \$500,000 or more annually. Excluded are the British Columbia Hydro and Power Authority Railway line and the Cartier Railway, and lines with annual revenues of less than \$500,000 annually, whose operations account for under 2 p.c. of the total.

Table 3 gives traffic and employment statistics for the above railways for the years 1966-70 and Table 4 gives similar data for the Canadian National and Canadian Pacific railways separately for 1969 and 1970.

<sup>1</sup> Total tonnage for 24 railways is sum of tonnages carried by individual railways; thus traffic handled by more than one railway (interline) is included more than once.

<sup>2</sup> Footnote <sup>1</sup> applies also to number of revenue passengers.

Total tonnage of freight carried by all common carrier railways (including national loadings and receipts from United States connections) in 1969 and 1970 is shown in Table 5 under the commodity structure adopted in 1970 based on Statistics Canada's Standard Commodity Classification. Although there will be some loss of continuity with previous data, this new commodity breakdown will permit greatly improved comparisons with other series on water transport, imports, exports, etc., which are already based on the Standard Commodity Classification. Also, some items, including potash and piggyback traffic, are shown for the first time in this new series.

### 5.—Commodities Hauled as Revenue Freight by Railways, 1969 and 1970

NOTE.—In this table duplications are eliminated, i.e., freight that is interlined between two or more Canadian railways is counted only once. The statistics do not cover United States operations of Canadian railways except for the Canadian Pacific Railway line through Maine, U.S.A., and certain other short mileages which are deemed to be an integral part of the Canadian railway system. Sections of United States railways operating into Canada are regarded as Canadian railways and are included. Freight carried by the Cartier Railway is included in this table; however, financial data for this railway are not available for inclusion in the financial tables.

<b>Grand Totals</b> .....	<b>208,991,838</b>	<b>233,163,455</b>

<sup>1</sup> Excludes traffic moved in railway-operated containers and trailers.<sup>2</sup> Includes express-rated traffic.

The railways remain indispensable for the movement of bulk commodities over long distances and are placing greater and greater emphasis on developing the most effective and economical methods of handling such freight.

Tables 6 to 12 give information on capital liability and capital investment in road and equipment, and on operating revenues, expenses and net income of all common carrier railways operating in Canada, except that of the Cartier Railway which is not available. A Uniform Classification of Accounts has been in operation for the Canadian National and the Canadian Pacific Railways since Jan. 1, 1956 and for other common carrier railways since Jan. 1, 1957. In transportation statistics, a distinction is made between expenditures and expenses. In the following data, the term 'expenses' is used as defined in the Uniform Classification of Accounts and refers to the expenses of furnishing rail transportation service and of operations incident thereto, including maintenance and depreciation of the plant used in such service.

### 6.—Capital Liability of Railways, 1961-70

(Exclusive of Canadian railway capital owned by other Canadian railways)

Year	Stocks	Funded Debt	Total	Year	Stocks	Funded Debt	Total

<sup>1</sup> Restated to reflect transfer of certain non-rail property of one railway to a subsidiary company.

<sup>2</sup> Restated to include Government of Ontario (GO) transit, not previously reported.

*Capital Structure and Financial Statistics of the Canadian National Railway System.*—In view of the interest in Canada's publicly owned railway, the capital structure of the Canadian National Railway System is given separately in Table 8 and financial details in Table 9. The original financial structure of the CNR and the steps taken through the Capital Revision Acts of 1937 and 1952 to alleviate the burden of interest undertaken by the company on its formation in 1923 are described in the 1955 Year Book, pp. 840-847. Briefly, the Capital Revision Act of 1937 wrote off all loans that had been made to cover deficits and also unpaid interest on loans, and certain loans made for the purpose of additions and betterments were converted to equity capital, relieving the CNR from paying fixed charges on this amount. Under the 1952 Capital Revision Act, 50 p.c. of the company's interest-bearing debt was changed to preferred stock on which, after settling income taxes, a dividend of 4 p.c. is paid out of earnings. Also, for a term of 10 years ended Jan. 1, 1962, the Railway was not obliged to pay interest on \$100,000,000 of its long-term debt. The Government is authorized to buy additional preferred stock annually in amounts related to the company's gross revenues. As a consequence, the proportion of total capitalization represented by equity capital in shareholders' account was raised from 34.5 p.c. at Dec. 31, 1951 to 67.2 p.c. at Jan. 1, 1952, and the proportion of borrowed capital was correspondingly reduced. By the end of 1970, the proportion represented by equity capital of total capitalization was 51.2 p.c.

#### 8.—Capital Structure of the Canadian National Railway System as at Dec. 31, 1961-70

At Dec. 31—	Shareholders' Capital		Funded Debt Held by Public		Government Loans and Appropriations—Active Assets in Public Accounts	Total

The financial details presented in Table 9 are those of the Canadian National Railway System, including both Canadian and United States operations. Revenues and expenses include those of express and commercial communications and highway transport (rail) operations. In conformity with the requirements of the Uniform Classification of Accounts adopted Jan. 1, 1956, tax accruals and rents are charged to operating expenses.

<sup>1</sup> Includes appropriations for insurance fund.

<sup>2</sup> Contributed by or paid to the Government of Canada.

*Revenues, Expenses and Net Income.*—Total operating revenues and expenses of common carrier railways operating in Canada (except the Cartier) continued to rise, both reaching peak levels in 1970; increases over 1969 amounted to 6.1 p.c. and 5.2 p.c., respectively. As a result, net operating revenues showed a rise of 21.1 p.c. to \$106,200,000.

Of the total operating expenses in 1970 amounting to \$1,573,578,729, "transportation" expenses, including the operation of trains, yards, stations, wharves, etc., accounted for 38.8 p.c.; equipment maintenance for 22.1 p.c.; road maintenance for 18.1 p.c.; rents and taxes for 7.4 p.c.; expenses connected with traffic soliciting, such as advertising and information, ticket and freight offices, etc., for 2.7 p.c.; and general and miscellaneous expenses, including general overhead, accounting, dining and buffet services, grain elevators, etc., for the remainder. These proportions have remained fairly constant in recent years.

**10.—Operating Revenues and Expenses of All Railways, 1961-70**

NOTE.—These data cover all common carrier rail operations in Canada and therefore do not agree with those presented in Table 11 which represent only 24 of the larger lines.

**Railway Accidents.**—Accidents shown in Table 12 (for all common carrier railways operating in Canada) include all those in which railway trains were involved and accidents on railway property; all passengers injured are included but, for employees, only those who were kept from work for at least three days during the 10 days following the accident are recorded. The classification of accidents used in reporting Statistics Canada highway

statistics treats collisions between motor vehicles and trains as motor vehicle accidents. Therefore, care should be exercised when compiling total accidental deaths of all kinds or when comparing data on accidents of different kinds, such as train and motor vehicle, since train-car collisions would be included in both.

## PART II.—ROAD TRANSPORT\*

### Section 1.—Motor Vehicle and Traffic Regulations

The registration of motor vehicles and the regulation of motor vehicle traffic lies within the legislative jurisdiction of the provincial and territorial governments. However, the Federal Government has recently passed legislation establishing motor vehicle safety standards. This legislation is outlined below, followed by summaries of motor vehicle and traffic regulations common to all provinces and territories. The source of information on detailed regulations for each province and territory is given at p. 889.

\* Except as otherwise indicated, most of the material in this Part has been revised in the Transportation and Public Utilities Division, Statistics Canada.

### Federal Safety Regulations

The Motor Vehicle Safety Act (RSC 1970, c. 26, 1st Supp.) which was passed by the House of Commons on Mar. 11, 1970, received Royal Assent on Mar. 25, 1970, and was proclaimed Jan. 1, 1971. The general objective of the Act is to establish mandatory safety standards for new motor vehicles for the purpose of protecting persons against injuries or death and the impairment of health by exhaust emission and possibly noise. The legislation is directed to all new motor vehicles and components thereof manufactured in or imported into Canada. The safety of vehicles in use continues to be a provincial responsibility to be discharged under existing provincial legislation.

The safety regulations currently include 30 standards relating to the design and performance of passenger cars, trucks, buses, motorcycles, competition motorcycles, minibikes and trailers, five standards limiting motor vehicle exhaust and evaporative emissions and 10 standards applying to snowmobiles. These regulations will be subjected to continual review and additions or revisions will be incorporated to keep pace with engineering or technical advances. The regulations require all Canadian motor vehicle manufacturers or distributors to apply the national safety mark to every classified vehicle produced after Jan. 1, 1971, and this mark must be accompanied by a label certifying compliance with all applicable federal motor vehicle safety standards. Vehicles imported for commercial or individual use must comply with the Act and Regulations.

### Provincial and Territorial Motor Vehicle and Traffic Regulations\*

**Operators' Licences.**—The operator of a motor vehicle must be over a specified age, usually 16 years (17 in Newfoundland and generally 18 in Alberta but 16 for certain classes of motor vehicle), and must carry a licence, obtainable in most provinces only after prescribed qualification tests. Such licence is renewable annually in Saskatchewan, in the Yukon Territory and in the Northwest Territories and annually at the end of the licensee's birth month in Manitoba; in Alberta it is renewable every five years but annually where a medical report is required; in British Columbia it is renewable every five years expiring on the licensee's birth date and classified according to the operations by the licensee; in Quebec, operator and chauffeur permits expire on the holder's birthday and the odd-numbered year following the issue of renewal thereof; in Prince Edward Island and New Brunswick it is renewable every two years and expires at the end of the licensee's birth month; in Newfoundland and Ontario a licence is issued on a three-year basis and expires on the licensee's birth date; and in Nova Scotia a licence is issued on a three-year basis and expires at the end of the licensee's birth month. Special licences are required for chauffeurs in all provinces except Newfoundland and British Columbia. In most provinces, a motorcycle operator is required to pass a special examination and have his driver's licence endorsed authorizing him to operate such vehicle or, if he has no driver's licence, he may be issued a licence to operate only this class of vehicle. In Alberta a person under 16 but not under 14 years of age is permitted to operate a motorcycle with a piston displacement of not more than 100 cc.

**Motor Vehicle Regulations.**—All motor vehicles and trailers must be registered annually, with the payment of specified fees, and must carry two registration plates, one on the front and one on the rear of the vehicle (one only for the rear of trailers; in New Brunswick two licence plates are issued for all vehicles other than commercial tractors, trailers and motorcycles; in Prince Edward Island, Quebec, Ontario, Manitoba, Alberta and British Columbia one plate is issued for motorcycles, to be mounted on the rear; in Saskatchewan, motorcycles and snowmobiles carry one plate on the rear and truck tractors carry one plate on the front; in Ontario, snowmobiles carry one plate on the front).

In most provinces, in event of sale the registration plates stay with the vehicle but in Quebec, Manitoba, Saskatchewan and Alberta the plates are retained by the owner. In

\* Revised according to information received from the respective provincial and territorial authorities concerned.

Nova Scotia, vehicles pass from owner to owner by due process of law and title must be secured before issue of plates and permit. A change of ownership of the vehicle must be recorded with the registration authority. However, exemption from registration is granted for a specified period (usually at least 90 days, except in Quebec where the maximum is three months for non-residents; in Nova Scotia, a non-resident full-time student residing temporarily in the province may receive, without fee, a driver's licence, plates and permit in exchange for valid out-of-town licence, plates and permit, the latter to be returned to the home province, state or territory of the student concerned; in Ontario where it is six months for non-resident vehicles from other provinces and three months for non-resident vehicles registered outside Canada; in Manitoba where residents may use registration plates from other jurisdictions for 90 days, visitors are exempt from registration provided the vehicle is not used for business purposes, and an out-of-province student is exempt from registration provided he obtains a student sticker to be affixed to his windshield and provided the vehicle is properly registered in his home jurisdiction; in Saskatchewan where an out-of-province student may on application extend the period of exemption from registration requirements for the whole school year, provided the vehicle is properly registered in his home jurisdiction; in Alberta where non-residents may operate vehicles currently registered in their home province or state of the United States for a period not exceeding six months and where an out-of-province student may extend the period of registration requirements for the whole school year provided the vehicle is properly registered and insured in the student's name in his home jurisdiction; and in British Columbia where it is one month or six months for tourists and where an out-of-province student may extend the period of registration requirements for the whole school year, provided the vehicle is properly registered in his home jurisdiction). Regulations require a safe standard of efficiency in the mechanism of the vehicle and of its brakes and stipulate that equipment include non-glare headlights, a proper rear light, a muffler, a windshield wiper, a rear-vision mirror, and a warning device. In Ontario, under a 1968 amendment to the Highway Traffic Act, a certificate of mechanical fitness is required for a vehicle sold on the second-hand market before a permit is issued for its operation. Prior to entering into a contract to sell a used motor vehicle every dealer shall give to the purchaser a certificate of mechanical fitness certifying that at the time of sale the motor vehicle complies with the equipment requirements specified in Part 3 of the Highway Traffic Act.

**Traffic Regulations.**—In all provinces and territories, vehicles keep to the right-hand side of the road. Everywhere motorists are required to observe traffic signs, lights, etc., placed at strategic points on highways and roads. The speed limit in Prince Edward Island, unless otherwise posted, is 60 miles an hour in daytime and 55 at night; in Manitoba, the basic speed limit is 60 miles an hour in daytime and 50 at night unless otherwise posted—speed limits may be raised to 70 miles an hour or modified in semi-built-up areas; in Alberta it is 60 in daytime and 50 at night, with the exception of a few selected sections of four-lane highway where higher speeds may be posted; in Nova Scotia the limit is a "reasonable and prudent" speed, with a maximum of 60 miles an hour except where 65 miles an hour is authorized; in New Brunswick, maximum speeds vary from 50 to 60 miles an hour depending on type of highway; and in Ontario and Quebec maximum speeds vary from 50 to 70 miles an hour, depending on type of highway. In the other provinces the maximum speed permitted is normally 50 miles an hour; in Saskatchewan and British Columbia where higher speeds are in effect they are posted. In Yukon Territory the speed limit for all vehicles is 60 miles an hour, unless otherwise posted. In the Northwest Territories, the highway limit is 60 miles an hour for all vehicles, day or night, except as otherwise posted, and in municipalities it is 30 miles an hour except as posted. Slower speeds are required in cities, towns and villages (in Nova Scotia and British Columbia when passing schools and public playgrounds), at road intersections, railway crossings or at other places or times where the view of the highway for a safe distance ahead is in any way obscured. In most provinces, truck speed limits are at least five miles an hour below automobile speed limits,

although in Manitoba, Saskatchewan and British Columbia they are the same as for passenger vehicles. In most provinces, accidents resulting in personal injury or property damage in excess of \$200 (\$100 in Quebec) must be reported to a police officer (in Nova Scotia to the Registrar of Motor Vehicles or to a police officer; in Quebec to a police officer or to the Motor Vehicle Bureau) and a driver involved must not leave the scene of an accident until he has rendered all possible aid and disclosed his name to the injured party.

**Driver Licensing Controls.**—All provinces and territories impose penalties for infractions of driving regulations, ranging from fines for minor infractions to suspension of the operator's driving permit, impounding of licence or imprisonment for more serious infractions. In most provinces penalties have been linked to a driver-improvement program, the aim of which is to correct faulty driving habits, not to take drivers off the road. The most common driver-improvement program includes the demerit-point-system.

**Safety Responsibility Legislation.**—Each province has enacted safety responsibility legislation. In general, these laws provide for the automatic suspension of the driver's licence and motor vehicle registration of a person convicted of a serious offence (impaired driving, driving under suspension, dangerous driving, etc.). It also provides for the automatic suspension of a person's driving licence and registration of the owner whose uninsured vehicle is involved directly or indirectly in an accident resulting in damage in excess of \$200 or injury or death to any person (in Nova Scotia, Ontario, Manitoba and Alberta the amount is \$100). In Saskatchewan, Alberta and Quebec, if a Judgment is rendered for damages against the driver or owner, the driver's licence and registration remain suspended until the Judgment is satisfied and proof of financial responsibility for the future is filed. In Saskatchewan, the Yukon Territory and the Northwest Territories uninsured motor vehicles may be impounded following an accident of any consequence, i.e., an accident resulting in personal injury or death, or property damage in excess of \$100 (\$200 in Saskatchewan and the Northwest Territories). In the Province of Quebec, furthermore, pursuant to the Code of Civil Procedure, the plaintiff may seize before Judgment the motor vehicle which has caused him damage whatever the amount of property damage whether covered for third-party insurance or not. In British Columbia, if a Judgment is rendered against a driver and not satisfied, the driver's licence may be suspended until reinstated at the discretion of the Superintendent of Motor Vehicles. In Ontario, Manitoba, Alberta and British Columbia the non-resident motorist is not required to carry or produce any form of proof of insurance. In Ontario, the only persons required to file a Certificate of Insurance are those indebted to the Motor Vehicles Accident Claims Fund. In Manitoba, proof of insurance must be supplied at the time of registration but if such insurance expires or is cancelled registration of the vehicle is not suspended unless the vehicle is involved in an accident. In British Columbia, a compulsory insurance plan is in effect for residents, and drivers may at any time be required to show proof of financial responsibility upon demand of a peace officer.

In the Yukon Territory an inadequately insured vehicle may be impounded if it is involved in an accident, regardless of the property damage, and in the Northwest Territories proof of insurance must be supplied before vehicle licence is issued, and when the insurance expires or is cancelled vehicle licence plates must be returned to the Registrar of Motor Vehicles. By order, the Yukon Commissioner and the Northwest Territories Commissioner may exempt certain areas from the insurance requirement. In the Northwest Territories, public liability and property damage insurance is compulsory for all vehicles operating on the highways of the Territories regardless of where the vehicle is registered.

**Unsatisfied Judgment Fund.**—Legislation has been enacted in all provinces except Saskatchewan and in the Yukon Territory, usually in the form of an amendment to the motor vehicle laws of the province or territory, providing for the establishment of a fund, frequently called an Unsatisfied Judgment Fund (in New Brunswick, the Unsatisfied Judgment Fee; in Ontario, the Motor Vehicle Accident Claims Fund; in Alberta, the Motor

Vehicle Accident Claims Fund; and in British Columbia, the Traffic Victims' Indemnity Fund), out of which are paid Judgments awarded for damages arising out of motor vehicle accidents in the province which cannot be collected in the ordinary process of law. In Newfoundland, Prince Edward Island, Nova Scotia, Quebec and British Columbia the fund is maintained by insurance companies. In all the other provinces, except Saskatchewan where insurance is compulsory, the funds are obtained by the annual collection of a fee from the registered owner of every motor vehicle or from every person to whom a driver's licence is issued. The fee usually does not exceed \$1 per annum; in New Brunswick the fee is \$3 a year; in Ontario a fee of \$25 is paid by the uninsured motorist (in the absence of the fee being paid the uninsured, if apprehended, is liable to a fine) and, in addition, the fund is subsidized by a \$1 annual charge from each licensed driver; in Alberta \$20 is collected from each uninsured owner of a motor vehicle at the time of registration or transfer.

A feature of this legislation, which is contained in some provincial statutes, is the provision for the payment of Judgments in hit-and-run accidents. When these occur, if neither the owner nor the driver can be identified, action may be taken against the Registrar of Motor Vehicles (the Minister of Finance in Newfoundland and the Administrator of the Motor Vehicle Accident Claims Fund in Alberta); any Judgment secured against the responsible authority is paid out of the Fund. All of these laws contain a provision limiting the amount that can be paid out of the Fund on one Judgment. In Newfoundland and Nova Scotia, the limits are \$10,000 for one person, \$20,000 for two or more persons injured in one accident and \$5,000 for property damage. In Nova Scotia and New Brunswick, the limit is \$35,000 in respect of any one accident. In Prince Edward Island and Quebec, the limit is \$35,000 for all damages in the same accident, subject to a deduction of \$200 from all damage to the property of others; damages resulting in bodily injury or death are, up to \$30,000, payable by priority over damages to property and the latter are, up to \$5,000, payable by priority over the former out of the amount of any insurance or other guarantee of indemnity. In British Columbia, the limit is based on the single amount of \$50,000 for any one accident with the provision that not more than \$5,000 may be paid on a property damage claim until injury claims up to \$45,000 have been satisfied; the \$50,000 limit exists for hit-and-run accidents but does not apply to payments for property damage. In Alberta, the limit is \$35,000 for death or personal injury to one or more persons and \$5,000 for damage to property, subject to a limit of \$35,000 in any one accident; where in one accident claims result from bodily injury to or death of one or more persons and loss of or damage to property, claims arising out of bodily injury or death have priority over claims arising out of loss of or damage to property to the amount of \$30,000, and claims arising out of loss of or damage to property have priority over claims arising out of bodily injury or death to the amount of \$5,000. In Manitoba, the limit based on one accident is \$50,000, with Judgments arising out of bodily injury or death having priority to the extent of \$30,000 over claims resulting from loss of or damage to property; and Judgments arising out of loss of or damage to property having priority to the extent of \$5,000 over Judgments resulting from bodily injury or death; the maximum amount payable for a single Judgment resulting from loss of or damage to property is \$3,000, subject to a deduction of \$200.

In Ontario, the Motor Vehicle Accident Claims Act passed in 1962 replaced the Unsatisfied Judgment Fund which had been in effect since 1947. The new Act was streamlined to adjust promptly and efficiently all those claims incurred by the uninsured motorist. Claims could be adjusted much the same as by the insurance companies. The limits under an amendment to the Act of September 1969 are \$50,000, inclusive of \$5,000 for any property damage claim. Many small claims are handled by the Ontario Department of Transport, subject to a \$50 franchise clause in respect to property damage, but the procedure is such that claims can be settled under Sect. 5 of the Act without resort to litigation. Sect. 6 covers Judgment cases and Sects. 11 and 14 cover the hit-and-run cases in which a Judgment is necessary and property damage is not payable. A 1968 amendment to the Act gave the Minister of Transport power to act where the defendant is an infant.

## Section 2.—Highways, Roads and Streets\*

The populated sections of Canada are well supplied with highways and roads. Access to outlying settlements is provided to some extent by roads built by logging, pulp and paper, and mining companies, although these are not generally available for public travel. At the same time, great areas of the provinces and territories are still very sparsely settled and are virtually without roads of any kind.

Table 1 shows that, at the end of 1969, there were 318,255 miles of highways and rural roads under federal or provincial jurisdiction and 199,932 miles of roads and streets under municipal jurisdiction. (Roads in municipalities of less than 1,000 population are included under "municipal" since 1969, whereas previously they were included as "rural roads".)

Table 2 gives expenditures on all highways, roads and streets in the years ended Mar. 31, 1969 and 1970. An estimate of the total as at Mar. 31, 1971 was \$1,957,000,000; construction expenditures increased 2.3 p.c. and maintenance and administration costs rose 13.0 p.c.

\* More detail may be obtained from Statistics Canada annual report *Road and Street Mileage and Expenditure* (Catalogue No. 53-201).

Laporte Bridge, which spans the St. Lawrence River immediately west of Quebec City, is a link in the great network of highways and autoroutes that traverse that province.

<sup>1</sup> Includes federal administrative costs re Trans-Canada Highway, not allocated by province, amounting to \$290,000 in 1968-69 and \$250,000 in 1969-70.

### Section 3.—Motor Vehicles

**Motor Vehicle Registrations.**—Registrations continue to increase year by year, a record of 8,495,581 being reached in 1970. Of that total, 6,602,196 were passenger cars. Registrations by province are given in Table 3 and types of vehicles registered by province in Table 4.

#### 3.—Motor Vehicles Registered, by Province, 1961-70

NOTE.—Registrations given here include passenger cars, trucks, buses, motorcycles, service cars, etc., but not trailers or dealer licences.

<sup>1</sup> Includes taxis.

<sup>2</sup> Includes service cars, road tractors, farm tractors, etc.

<sup>3</sup> Included with trucks.

**Apparent Supply of Automobiles.**—The apparent supply of automobiles in Canada in any year is computed by deducting the number exported from the sum of the production and imports. Statistics regarding retail sales and the financing of motor vehicle sales are given in Chapter XX on Domestic Trade and Prices.

### 5.—Apparent Supply of New Automobiles, 1961-70

**Provincial Government Revenue from Motor Vehicles.**—The taxation of motive fuels, motor vehicles, garages, drivers, chauffeurs, etc., is an important source of provincial government revenue. In every province, licences or permits duly issued by the provincial authorities are required for motor vehicles of all kinds, trailers, operators or drivers, paid chauffeurs, dealers, garages and gasoline and service stations.

The more important sources from which provincial revenue from motor vehicles is derived are shown in Table 6. Motive fuel tax rates are given in the Public Finance Chapter, Section 2, Subsection 2 on Provincial Taxes; Federal Government revenue from excise and sales taxes is given in the same Chapter, Section 3, Subsection 3 on Revenue from Taxation.

<sup>1</sup> Operators' licences are issued for different periods in different provinces: see p. 885 for provincial regulations.

<sup>2</sup> Includes other items not shown such as transfer of motor vehicles, garage and service station licences, and fines for infractions of motor vehicle laws.

<sup>3</sup> Included with other motor vehicles.

<sup>4</sup> Included with miscellaneous revenues and therefore in total.

<sup>5</sup> Included with passenger automobiles.

<sup>6</sup> Not complete.

**Sales of Motive Fuels.**—In order to estimate the total amount of motive fuel purchased in Canada for use in motor vehicles on public streets and highways, it has been necessary to eliminate from the total the amount of motive fuel used for other purposes. Thus, from the total or gross sales, including imports and exports, the following are subtracted to obtain net sales: tax exempt sales to the Federal Government and other consumers, exports, and sales on which refunds were paid. Net sales are thus defined as sales on which a tax or taxes have been paid in full and are considered to approximate the actual amount of motive fuel purchased in Canada for use on public streets and highways. As shown in Table 7, consumption of taxable gasoline, which is used almost entirely for automotive purposes, rose 5.7 p.c. in 1969 and net sales of diesel oil 13.0 p.c.

**Household Goods Movers and Storage Operators.†**—Statistics of household goods movers and storage operators, summarized in Table 9, were first presented separately in 1960; before that date, they were included either with motor carriers—freight or with warehousing, depending upon the predominant source of operating revenues of the companies concerned.

\* Statistics are given in more detail in Statistics Canada annual report *Motor Carriers—Freight*, Part I (Catalogue No. 53-222) and Part II (Catalogue No. 53-223).

† Statistics are given in more detail in Statistics Canada annual report *Moving and Storage, Household Goods* (Catalogue No. 53-221).

**Passenger Buses.\***—The operations of companies predominantly engaged in passenger bus service are summarized in Table 10. Data refer to the for-hire segment of the industry. Only firms engaged in intercity and rural operations and having an annual gross revenue of \$6,000 or over are covered. Operators predominantly involved in the provision of school bus service are not included nor are airport servicing and urban transit bus operators.

\* Statistics are given in more detail in Statistics Canada annual report *Passenger Bus Statistics* (Catalogue No. 53-215).

**10.—Summary Statistics of Intercity and Rural Passenger Bus Companies, 1965-69**

NOTE.—Only carriers with annual gross revenue of \$6,000 or over are included.

<sup>2</sup> Excludes British Columbia Hydro and Power

There are two subway systems in operation in Canada; the Toronto subway, which was officially opened on Mar. 30, 1954 and the Montreal subway, which began public operation on Oct. 17, 1966.

**Motor Vehicle Traffic Accidents.**—There were 532,881 motor vehicle traffic accidents reported in 1969 compared with 484,436 in the previous year. Deaths from such accidents numbered 5,318 in 1968 and 5,425 in 1969 as against 3,231 in 1959. Statistics for 1969, reported by place of occurrence, are given by province in Table 12 but it should be noted that, although motorists are required by law to report accidents, complete statistics of these accidents are not available for all provinces.

## PART III.—WATER TRANSPORT\*

**The Canada Shipping Act.**—Legislation regarding shipping is consolidated in the Canada Shipping Act (RSC 1970, c. S-9). Under the Act and its amendments, the Parliament of Canada accepts full responsibility for the regulation of Canadian shipping.

### Section 1.—Shipping Facilities and Traffic

#### Subsection 1.—Shipping

All Canadian waterways including canals, lakes and rivers are open on equal terms, except in the case of the coasting trade, to the shipping of all countries of the world so that Canadian shipping must compete with foreign flag shipping.

Within the region from approximately Havre St. Pierre on the St. Lawrence River upstream to the head of the Great Lakes, the carriage of goods or passengers from one

\* Information and statistics dealing with this subject have been supplied as follows: aids to navigation, canals, harbours, administrative services and marine services by the Ministry of Transport and the National Harbours Board; the St. Lawrence Seaway by the St. Lawrence Seaway Authority; canal traffic and statistics of shipping by the Transportation and Public Utilities Division, Statistics Canada; and shipping subsidies by the Director of Subsidized Steamship Services, Water Transport Committee, Canadian Transport Commission.

Canadian port to another Canadian port, commonly known as the coasting trade, is restricted to ships registered in Canada. Elsewhere in Canada, the coasting trade is open to all Commonwealth ships.

**Canadian Registry.**—Under Part I of the Canada Shipping Act, ships in excess of 15 tons net register and pleasure yachts in excess of 20 tons net are required to be registered; ships of lower tonnage may be registered voluntarily, otherwise they are required to be operated under a Vessel Licence if powered by a motor of 10 hp. or more. Sect. 6 of the Act restricts ownership to British subjects or bodies corporate incorporated under the law of a country of the Commonwealth or of the Republic of Ireland and having their principal place of business in those countries. Under the British Commonwealth Merchant Shipping Agreement, all Commonwealth ships are given the general designation 'British Ship', and a ship that should be but is not registered is not entitled to the privileges accorded to British ships. Ships in the planning stage or in course of construction may be recorded before registry by a Registrar of Shipping at one of the 75 Ports of Registry in Canada.

The freight movement through a large port takes a number of different forms. These include cargoes for or from foreign countries and cargoes loaded and unloaded in coastwise shipping, i.e., domestic freight moving between Canadian points. There is, as well, the in-transit movement in vessels that pass through the harbour without loading or unloading and the movement from one point to another within the harbour, which in many ports amounts to a large volume.

Shipping statistics, which cover traffic in and out of both customs and non-customs ports, do not include freight in transit or freight moved from one point to another within the harbour. Table 4 shows the principal commodities loaded and unloaded in foreign and coastwise shipping at the 17 ports handling the largest cargo volumes in 1969. These ports handled 74.6 p.c. of all Canada's international shipping and 52.9 p.c. of the coastwise trade. The specific commodities shown are those transported in volume and often in bulk form.

#### 4.—Principal Commodities in Water-Borne Cargo Loaded and Unloaded at Ports Handling the Largest Tonnages in 1969

NOTE.—Only commodities totalling over 50,000 tons are listed.

### Subsection 2.—Ports and Harbours

Water transportation cannot be studied with any degree of completeness without taking into consideration the co-ordination of land and water transportation at many of the ports. Facilities provided to enable interchange movements include the necessary docks and wharves, some for passenger traffic but most of them for freight, warehouses for handling general cargo, and special equipment for bulk freight of all kinds. Facilities may include cold storage warehouses, harbour railway and switching connections, grain elevators, coal bunkers, oil storage tanks and, in the chief harbours, vessel repair docks. In recent years, modern container terminals have been built at a number of Canadian ports to handle the increasing volume of containerized freight moving in international trade. These terminals represent large capital investments in property, specially designed gantry cranes, and associated materials-handling equipment.

In 1970, the Ministry of Transport formed the Canadian Marine Transportation Administration to co-ordinate all federal waterways and harbour services provided by the National Harbours Board, Harbour Commissions, and the public harbours and wharf facilities under the direct supervision of the Ministry. Nine of the principal harbours of Canada\* are administered by the National Harbours Board and 11 other major harbours are administered by Harbour Commissions, which include municipal as well as Federal Government appointees. In addition, there are some 300 public harbours under the direct supervision of the Ministry of Transport, administered under rules and regulations approved by the Governor General in Council. Harbour masters are appointed by the Minister of Transport for these harbours, their remuneration being paid from fees levied on vessels.

\*In March 1972 the Port of Prince Rupert B.C., became the tenth port to be administered by the NHB.

*The container terminal within Burrard Inlet, Vancouver Harbour, became operative in 1970. More than 27,000,000 tons of cargo were handled by the facilities of the Port of Vancouver during that year.*

Throughout the country there are several thousand wharves and breakwaters administered by the Ministry of Transport under the Government Harbours and Piers Act. These facilities are for the accommodation of cargo ships and commercial fishing craft and are under the general supervision of the Ministry of Transport regional and district offices. Wharfingers, whose remuneration is determined as a percentage of wharfage fees collected, are appointed for the direct supervision of these public wharves and floats. The wharves are designed to accommodate the smallest fishing or pleasure craft or the largest ocean-going vessels, according to local requirements. At many ports, in addition to public harbour works operated by the administering authority, there are extensive dock and handling facilities owned by private companies including railway, lumber, pulp and paper, coal, steel, iron ore, petroleum, grain, fish and other industries moving large volumes of bulk material. In 1970, Canadian harbours handled more than 291,000,000 tons of cargo in 211,000 vessel arrivals and departures in international seaborne and coastwise shipping.

**National Harbours Board.**—The National Harbours Board, a Crown corporation established in 1936, is charged with the administration and operation of the following properties:\* port facilities such as wharves and piers, transit sheds, grain elevators, cold storage warehouses, terminal railways, etc., at the harbours of St. John's (Nfld.), Halifax, Saint John (N.B.), Belledune (N.B.), Chicoutimi, Quebec, Trois-Rivières, Montreal, Churchill and Vancouver; grain elevators at Prescott and Port Colborne in Ontario; and the Jacques Cartier and Champlain Bridges at Montreal.

The capital values of the fixed assets administered by the Board at Dec. 31, 1970 amounted to \$413,587,062; this figure includes expenditure on all buildings, machinery and durable plant improvements less deductions for depreciation, and therefore represents a fair approximation of the present value of the properties. The total amount advanced by the Federal Government to the National Harbours Board for capital expenditure during 1970 was \$5,374,764, distributed as follows: Halifax, \$2,500,000; Quebec, \$800,000; Vancouver (Roberts Bank), \$518,683; and Vancouver (Burrard Inlet Crossing), \$1,556,081.

\*See footnote to p. 906.

#### 5.—Summary Traffic Statistics for Harbours Administered by the National Harbours Board, 1969 and 1970

## Subsection 3.—Canals

The canals and canalized waters of Canada under the jurisdiction of the Ministry of Transport, together with those under the jurisdiction of the St. Lawrence Seaway Authority, comprise a series of waterways providing navigation for 1,875 miles inland from salt water.

Those included under the two classifications—Seaway canals and Ministry of Transport canals—are listed in Table 6 with their locations, lengths and lock complement. In addition to these, the federal Department of Public Works administers the St. Andrew's Lock (length, width and draught, respectively, 215, 45 and 17 feet) on the Red River at Selkirk, Man., and the lock at Poupore, Que. A few small locks are operated by provincial authorities.

During 1970, 116,998,426 tons of freight and 19,834 vessels passed through the canals as compared with 97,357,234 tons of freight and 19,710 vessels during 1969. In addition to freight and passenger vessels, thousands of pleasure craft are locked through the canals. Vessels locking at Sault Ste. Marie during 1970 carried 205,588 passengers as compared with 192,891 in 1969.

**6.—Lengths of Channels and Dimensions of Locks under the Control of the St. Lawrence Seaway Authority or the Ministry of Transport**

Cargo passing through the Canadian lock and the United States locks at Sault Ste. Marie during 1970 totalled 101,402,636 tons—more than the 98,506,987 tons during the 1969 season but appreciably less than the record 128,489,170 tons reported for 1953. The United States locks, because of their larger facilities, accounted for all but 1,352,016 tons of the total. Iron ore, grains and coal normally contribute more than 90 p.c. of the combined tonnage moving through the Canadian and United States locks, most of it downbound. Because upbound transits are often in ballast, the 1970 upbound cargo accounted for only 10,447,902 tons of the total and consisted mainly of coal, gravel, liquid fuels and manufactured goods. Iron ore mines contributed 69,422,152 tons or 68.5 p.c. of the total 1970 traffic as against 74,583,888 tons in 1969, and wheat shipments were 11,498,279 tons as against 7,960,799 tons in the same comparison. A relatively small volume of wheat moves directly overseas—most of it is carried by the laker fleet to elevators along the St. Lawrence River to await trans-shipment to ocean-going vessels. Bituminous coal recorded an increase in 1970 to 6,721,114 tons from 6,571,324 tons in 1969.

**Canadian Use of the Panama Canal.**—The use of the Panama Canal as a transport facility for the movement of goods from one Canadian port to another is of relatively minor importance. Of the total of 5,814,557 long tons of cargo leaving the West Coast of Canada in the year ended June 30, 1970 and passing through the Panama Canal, none were destined for eastern Canadian ports. Similarly, of the 1,727,958 long tons of cargo leaving eastern Canadian ports and passing through the Panama Canal, none were destined for western Canadian ports. The total tonnage passing through the Panama Canal and arriving in Canadian West Coast ports from any origin, Canada or elsewhere, amounted to 1,203,718 long tons in the year ended June 30, 1970; the total from any origin arriving at eastern Canadian ports after having passed through the Panama Canal was 759,483 long tons.

#### Subsection 4.—The St. Lawrence Seaway

Events leading up to the beginning of the St. Lawrence Seaway project and the progress made during the years of its construction are covered in the 1954 to 1959 Year Books. The 1956 edition (pp. 821-829) gives detailed information on Great Lakes-St. Lawrence waterway traffic immediately prior to the beginning of construction on the project and the 1960 Year Book (pp. 851-860) relates the story of the Seaway during the second year of its operation. The first decade of Seaway development and operations is discussed in the 1969 edition (pp. 841-845).

The St. Lawrence Seaway Authority, constituted as a Corporation by Act of Parliament in 1951 (RSC 1970, c. S-1), undertook the construction (and subsequent maintenance and operation) of Canadian facilities between Montreal and Lake Erie to allow 27-foot navigation, concurrently with the construction of similar facilities in the International Rapids Section of the St. Lawrence River by the Saint Lawrence Seaway Development Corporation of the United States. The Seaway was opened to commercial traffic on Apr. 1, 1959 and officially opened on June 26, 1959. With the opening of the Seaway, certain ancillary canals were transferred to the jurisdiction of the St. Lawrence Seaway Authority for operation and maintenance purposes. These include the Lachine, a section of the Cornwall Canal, a portion of the third Welland Canal and the Canadian lock at Sault Ste. Marie. Tolls are not assessed against vessel movements on these waterways and traffic data for them are not included in this Subsection. Major construction undertaken in 1967 was on the channel to bypass the city of Welland, scheduled for completion by the navigation season of 1973.

*Construction of the 8.5-mile Welland bypass channel, which will replace the narrow winding section that bisects the city of Welland, will be completed by the opening of the 1973 navigation season.*

**Seaway Traffic.**—Tables 12 and 13 give combined traffic statistics of the St. Lawrence and Welland Canals for the years 1969 and 1970. Duplicate transits are eliminated so that the figures show the actual total movement of goods through the St. Lawrence Seaway.

### 12.—Summary Statistics of St. Lawrence Seaway Traffic, 1969 and 1970

<b>Totals</b>	<b>66,401,570</b>	<b>100.0</b>	<b>60,815,992</b>	<b>100.0</b>	<b>71,113,672</b>	<b>100.0</b>

In 1970, 4,542 ships carrying about 27,864,000 tons of cargo moved upbound through the Seaway and 4,573 vessels carrying 43,249,000 tons moved downbound. Ocean-going ships carried 20.1 p.c. of the total cargoes and lakers 79.9 p.c. Of the total tonnage carried upbound in 1970, 21,868,000 tons were domestic cargo and 5,996,000 tons were foreign traffic; downbound, 34,953,000 tons were domestic freight and 8,296,000 tons were carried to and from foreign ports.

On the Montreal-Lake Ontario section, upbound traffic amounted to 25,213,000 tons in 1970 and downbound traffic to 25,930,000 tons, an increase of 24.7 p.c. over 1969. Almost 58.7 p.c. of the former was accounted for by iron ore shipped from St. Lawrence ports to Hamilton and Lake Erie, and the latter consisted largely of overseas shipments of wheat. There were 79 fewer upbound transits and 36 fewer downbound transits in 1970 than in 1969, indicating a slight decrease in the number of vessels using this portion of the Seaway. Bulk cargo comprised 87.2 p.c. of the total traffic through the section in 1970, the principal commodities through the St. Lawrence canals being iron ore, wheat, barley, manufactured iron and steel, fuel oil and corn. Traffic patterns show that 33.1 p.c. of the total movement was between Canadian ports; 38.6 p.c. moved between Canadian and United States ports; and 28.0 p.c. consisted of foreign trade to and from Canada and the United States. The small remainder was traffic between ports in the United States.

There were 7,111 transits through the Welland Canal in 1970, with a cargo volume of 21,143,000 tons upbound and 41,726,000 tons downbound; bulk cargo accounted for 90.7 p.c. of the traffic. Although many vessels pass through both the St. Lawrence and Welland Canals on "through" trips, there is a substantial amount of local traffic between Great Lakes ports which involves only the Welland Canal. These movements are largely of iron ore, grain and coal. The Welland Canal traffic was 9,337,000 cargo tons greater than that reported for the Montreal-Lake Ontario section.

Income of the St. Lawrence Seaway Authority for 1970 amounted to \$24,700,033, comprising toll revenue of \$22,143,453 assessed for transits through the Seaway locks between Montreal and Lake Ontario and sundry revenues (rentals, wharfage, bridge revenue, etc.) of \$2,556,580. Total expenses for 1970 amounted to \$19,364,505 of which operation and maintenance expenses amounted to \$13,198,278, regional headquarters, headquarters administration and engineering expenses to \$5,370,708, and construction to \$795,519.

## Section 2.—Marine Services of the Federal Government

The Marine Services of the Ministry of Transport consists of four operational Branches—Marine Works, Marine Operations, Marine Regulations and Marine Hydraulics—and two service Branches—Marine Finance and Marine Personnel. Each Branch is headed by a Director responsible to the Deputy Administrator, Marine Services, Canadian Marine Transportation Administration.

The *Marine Works Branch* responsibilities include provision and maintenance of aids to navigation, maintenance and management of Canada's secondary canals, administration of public harbours and wharves, and general supervision of harbour commissions. The Branch is also responsible for the removal of wrecks, and the investigation and subsequent approval of all works placed in, on, over or under the waters of Canada for the protection of navigation. It has three Divisions—Aids to Navigation, Canals, and Harbours and Property.

The *Marine Regulations Branch*, with two Divisions—Steamship Inspection and Nautical and Pilotage—is responsible for the administration of those parts of the Canada Shipping Act that relate to the operations of Canadian ships and ships within Canadian waters. It is charged with the registry and licensing of ships, the certification of ships' officers and the engagement and discharge of ships' crews. Other responsibilities include pilotage, safety inspection of ships, handling of dangerous cargoes, prevention of oil pollution of Canadian waterways and air pollution by ships, and the investigation of marine accidents. It is also responsible for the co-ordination of Canada's participation in the Inter-Governmental Maritime Consultative Organization, a United Nations body charged with the promotion of marine safety on an international basis.

The *Marine Operations Branch* is responsible for operating the Ministry fleet—the Canadian Coast Guard—consisting of 88 active ships of various types including heavy, medium and light icebreakers, an icebreaking cable repair ship, and two weather-oceanographic ships which alternate in manning Pacific Weather Station "Papa", 900 miles west of Victoria, B.C.

A principal duty of the fleet is to install, service and supply the thousands of light stations, shore lights, buoys and other aids to navigation along Canada's coasts and inland waterways. Coast Guard ships, including icebreakers, take part each summer in the Ministry's Arctic re-supply operations, moving some 100,000 tons of cargo to more than 40 ports of call in the Far North. These ships work in conjunction with a number of chartered commercial vessels which carry most of the cargo. During the winter, the icebreakers operate in support of commercial shipping in the Gulf of St. Lawrence from Cabot Strait to the Quebec North Shore. They also operate in the St. Lawrence River to break ice jams and prevent flooding, particularly in the section between Trois-Rivières and Montreal.

The Coast Guard ships assist with projects of other Canadian Government departments. For instance, scientific programs are carried out by research teams based aboard various ships ranging from the Great Lakes to the High Arctic in such fields as oceanography, hydrography and related sciences; departments concerned with the development of the Canadian Arctic and with the welfare of its population carry out their undertakings with the aid of Coast Guard ships; and Coast Guard ships patrol the St. Lawrence ship channel to ensure that it is maintained at its advertised depth. The bulk of marine search and rescue is carried out by Coast Guard ships. At present, seven offshore patrol cutters, three Great Lakes patrol cutters, six lifeboats, six launches and one hovercraft are engaged in this mission.

To provide officers for its ships, trained in Coast Guard work, the Coast Guard College was established near North Sydney, N.S.

The *Marine Hydraulics Branch* comprises three Divisions—Hydraulics Studies, St. Lawrence Ship Channel, and Marine Traffic Control. The Hydraulics Studies Division

carries out and integrates hydraulic engineering studies, research, standards, planning and programming related to marine transportation facilities for commercial shipping in waterways where the Ministry has responsibilities. These activities, which are related mainly to the St. Lawrence River below Montreal, involve extensive use of hydraulic models during the development engineering phase of the program. The Division also provides technical advice and engineering assistance to Senior Management, and other agencies and departments in matters relating to marine transportation, water resources management and boundary waters investigations.

The St. Lawrence Ship Channel Division, located in Montreal, has the function of operating, dredging and maintaining navigation channels in the St. Lawrence River below Montreal and in the Saguenay River. The St. Lawrence ship channel extends from about 40 miles below Quebec City to Montreal, a distance of 200 miles; about 130 miles of this distance is dredged channel. In the Montreal-Quebec Reach, the channel has a limiting depth of 35 feet at extreme low water and a minimum width of 800 feet. Below Quebec, limiting depth of the dredged channel, about 15 miles in length, is 30 feet at low tide, with a width of 1,000 feet. This restricted depth section is now being deepened to provide 41 feet at low tide to allow access of large, deep-draught ships in the 100,000-ton class to the Port of Quebec. The three-year dredging contract, awarded in 1971, requires the removal of about 14,000,000 cubic yards of material at a cost of \$21,000,000.

In the interests of St. Lawrence River traffic safety, a Marine Traffic Control Service was established on Apr. 3, 1967, as a result of studies initiated by the Ministry in 1964. Using very high frequency (VHF) radio equipment, the Service keeps track of ship traffic in much the same way as the air traffic controllers watch over the busy sky lanes, aided by a computer which automatically portrays the ships moving along a wall display. The information needed to assist ships' masters in the safe conduct of their vessels comes from two main traffic control centres—one at Quebec and the other at Montreal—six shore stations and 18 reporting points along the river between Montreal and Les Escoumins, Que. All ships navigating the river must be equipped with the required VHF equipment to take advantage of the service. Since its inception, the system has been extended to Sept Îles and includes the waters of the Saguenay River to Chicoutimi.

**Field Organization.**—In the field, a regional management organization within the Marine Services is being developed. This system will provide the Ministry with more efficient means of matching resources to workloads in all areas. Included in the completed system will be the 11 district marine agencies that have existed for many years, and some 15 other Marine Services field offices that in the past have been reporting individually to Marine Services directors or to the Administrator, Canadian Marine Transportation Administration.

The first step was completed in 1967 with the establishment of the Maritime Region. This covers the Maritime Provinces and their outlying islands including Sable Island and the Magdalen Islands, and embraces all Marine Works, Marine Operations and Marine Regulations activities in the three provinces. In 1968, the Western Region, including the Pacific Coast, western and northwestern Canadian waterways and the western Arctic, was established with the same responsibilities as the Maritime Region. Later, the Province of Newfoundland (and Labrador) was reorganized using an area concept with Marine Works, Marine Operations, and Marine Regulations activities for the province reporting through an Area Manager located at St. John's. The Laurentian Region will be established early in 1972.

**Aids to Navigation.**—The Canadian system of aids to navigation is similar to that of other North American countries. Such aids maintained by the Ministry of Transport for Canadian and contiguous waters consist of buoys, lighthouses, day beacons, radio

beacons and two electronic networks operating on the hyperbolic principle—Loran and Decca. The numbers of danger signals maintained during the years ended Mar. 31, 1969 and 1970 were:—

<u>Type of Aid</u>	<u>1968-69</u>	<u>1969-70</u>
	No.	No.
Lights.....	3,853	3,950
Fog signals.....	384	384
Lighted buoys.....	2,300	2,325
Unlighted buoys and beacons.....	15,842	15,594

All aids incorporating light or sound devices are listed in the Ministry of Transport annual publication *List of Lights and Fog Signals*. Information on the radio beacons and on Loran and Decca is published in *Radio Aids to Marine Navigation*.

**Steamship Inspection.**—The Steamship Inspection Service was established by authority of the Canada Shipping Act. Its functions include the formulation and subsequent enforcement of regulations concerned with the approval of design of hulls, machinery and equipment of ships; inspection during construction; periodic inspection and issuance of inspection certificates; the assignment of load lines; the conditions under which dangerous goods may be carried in ships; the protection against accident of workers employed in loading and unloading ships; the protection from pollution of Canadian territorial waters by oil, chemicals, garbage, sewage or any other substances from ships; control of pollution of the atmosphere by smoke emitted by ships; control of the powering, equipment, load and horse-power capacity of small vessels; and the certification of marine engineers. The Board also prepares correspondence courses in marine engineering for use in Marine Engineering Schools now controlled by the Department of Labour.

The Chairman and the Board of Steamship Inspection are located at Ottawa and field offices are maintained in the principal ocean and inland ports. A total of 1,771 vessels of Canadian ownership or registry, including 446 passenger ships, 107 new ships built in Canada, 11 ships built outside Canada for registry in Canada, and 18 converted or reconditioned ships were inspected during the year ended Mar. 31, 1970.

**Pilotage.**—Pilotage service functions under the provisions of Part VI and Part VIa of the Canada Shipping Act. Wherever a pilotage district has been created by the Governor in Council, qualified pilots are licensed by the pilotage authority of the district. There are in Canada 24 pilotage districts, in eight of which the Minister of Transport is the pilotage authority (see Table 15); in each of the other districts the authority is a local body appointed by the Governor in Council. There are also three districts that are administered jointly by Canada and the United States, and one area in which the Ministry of Transport provides qualified pilots.

**15.—Pilotage Service, by Pilotage District, 1969 and 1970**

## PART IV.—CIVIL AIR TRANSPORT

### Section 1.—Civil Aviation Administration and Policy

**Administration.**—Civil aviation in Canada is under the jurisdiction of the Federal Government and is administered under the authority of the Aeronautics Act and the National Transportation Act and amendments thereto. The Aeronautics Act is in three parts. Broadly speaking, Part I deals with the technical side of civil aviation comprising matters of registration of aircraft, licensing of airmen, the establishment and maintenance of airports and facilities for air navigation, air traffic control, accident investigation and the safe operation of aircraft. This Part of the Act is administered by the Director General, Civil Aeronautics, under the supervision of the Administrator, Canadian Air Transportation Administration, Ministry of Transport. Part II of the Act deals with the economic aspects of commercial air services and assigns to the Canadian Transport Commission certain regulatory functions of commercial air services (see p. 942). Part III deals with matters of government internal administration in connection with the Act.

**International Air Agreements.**—The position of Canada in the field of aviation as well as its geographical location makes imperative its co-operation with other nations of the world engaged in international civil aviation. Canada therefore took a major part in the original discussions that led to the establishment of the International Civil Aviation Organization (ICAO) which has headquarters at Montreal, Que. In 1971, Canada had air agreements with 26 other countries. In August of that year, Germany abrogated the air agreement with Canada, with termination to take effect in 12 months. However, air services continue to be operated by Air Canada and Lufthansa.

**Federal Civil Aviation Policy.**—The intent of Federal Government concern in civil aviation is to provide an efficient and stable service for the Canadian public and the best possible economic framework for the orderly development of commercial aviation. In formulating its aviation policy in 1964, three principles were accepted by the Government as basic. The first related to the international field and stated that air services provided by Canadian airlines should serve the Canadian interest as a whole; that these services should not be competitive or conflicting but should represent a single integrated plan which could be achieved by amalgamation, by partnership or by a clear division of fields of operations. By a further policy statement in June 1965, the Minister of Transport defined more precisely the respective areas of operation of Air Canada and Canadian Pacific Air Lines Limited (CP Air) and additional international air services have since been introduced consistent with Government policy.

The second principle concerned the domestic mainline services and stated that, although competition was not to be rejected, development of competition should not compromise or seriously injure the economic viability of Air Canada's domestic operations which represent the essential framework of its network of domestic services, and in the event that competition continues, opportunity should be ensured for growth to both lines above this basic minimum. In accordance with this principle, the Government authorized the Canadian Transport Commission to permit CP Air to operate additional transcontinental air services, and to serve Calgary, Edmonton and Ottawa in addition to Vancouver, Winnipeg, Toronto and Montreal which were already being served.

The third principle concerned the role of regional air carriers providing scheduled service and their relationship with the mainline carriers. Recommendations were prepared by the two major airlines and the larger regional carriers which resulted in a "Statement of Principles for Regional Air Carriers" tabled in the House of Commons on Oct. 20, 1966, by the Minister of Transport. These principles are summarized as follows:—

- (1) Regional carriers will provide regular route operations into the North and will operate local or regional routes to supplement the domestic mainline operations of Air Canada and CP Air; they will be limited to a regional role.

- (2) Greater scope will be allowed regional carriers in the development of routes and services by the following means: (a) where appropriate, limited competition on mainline route segments of Air Canada or CP Air may be permitted to regional carriers if this is consistent with their local route development; (b) in a few cases, secondary routes at present operated by Air Canada and CP Air may become eligible for transfer to regional carriers; and (c) a larger role will be allotted to regional carriers in connection with the development of domestic and international charter services, inclusive tours and new types of services.
- (3) Greater co-operation between the mainline carriers and the regional carriers will be developed in a variety of fields, ranging from technical and servicing arrangements to joint fare arrangements.
- (4) A limited policy of temporary subsidies for regional routes will be introduced, to be based upon a "use it or lose it" formula.
- (5) Firmer control will be exercised over the financial structure of regional carriers in connection with new licensing arrangements.
- (6) Regional carriers will be assisted with the acquisition of aircraft by development of a scheme for consultation between government and the carriers regarding plans for new aircraft, and by a special investigation designed to explore the possibility of developing a joint approach to this problem on the part of the carriers.

In a statement made on Aug. 15, 1969, the Minister of Transport defined more precisely the regions in which each of the five regional carriers would be permitted to supplement or authorized to replace mainline operations as circumstances warranted, and authorized the Canadian Transport Commission, in consultation with the mainline carriers and appropriate regional carriers, to give urgent consideration to the application of the regional policy. During 1969, the Air Transport Committee issued a number of decisions authorizing new services by regional air carriers in accordance with the Regional Air Policy, and the Committee is continuing an orderly application of this policy in consultation with the mainline and regional carriers, and in accordance with the procedures of the Canadian Transport Commission.

Thus, in the international field, the joint approach to the provision of world-wide service by the two major Canadian carriers is intended to strengthen their position in a very competitive field and provide a better over-all service to the travelling public. In the domestic field, a degree of competition remains to provide the public with the advantages that can result from a competitive atmosphere but avoids excesses of competition that could be ruinous to the operators and unsatisfactory to the public.

## Section 2.—Current Air Services

The Canadian flag carriers operating international and domestic air routes are Air Canada and CP Air, which together earn 77 p.c. of the total operating revenues of Canadian commercial air carriers. The five regional carriers (Eastern Provincial Airways, Nordair, Quebecair, Pacific Western Airlines and TransAir) earn 12 p.c. of the total operating revenues. The remaining 11 p.c. is earned by some 500 smaller airlines, many of them operating in Canada's hinterland which is relatively inaccessible by surface transport. On international routes, the Canadian flag carriers provide scheduled services to Europe, the Soviet Union, Asia Minor, Japan and Hong Kong, Central and South America, the Caribbean, Australia and the United States (including Hawaii). Thirty-two foreign airlines have scheduled services between Canada and other countries (see pp. 925-926).

The Canadian Transport Commission (Air Transport Committee) in its Directory of Canadian Commercial Air Services classifies commercial air carriers into two major groups—domestic and international—and divides these groups into nine classes:—

### DOMESTIC AIR CARRIERS—

- (1) *Scheduled Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft, serving designated points in accordance with a service schedule and at a toll per unit;
- (2) *Regular Specific Point Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft serving designated points on a route pattern and with some degree of regularity, at a toll per unit;

**DOMESTIC AIR CARRIERS—concluded**

- (3) *Irregular Specific Point Air Carriers*—which offer public transportation of persons, mails and/or goods by aircraft, from a base named in the licence, serving a specific point or points, at a toll per unit;
- (4) *Charter Air Carriers*—which offer public transportation of persons and/or goods by aircraft, from a base named in the licence, at a toll per mile or per hour for the charter of the entire aircraft, or at such other tolls as may be permitted by the Air Transport Committee;
- (5) *Contract Air Carriers*—which do not offer public transportation but which transport persons and/or goods solely in accordance with one or more specific contracts;
- (6) *Flying Clubs*—which are air carriers incorporated as non-profit organizations for the purpose of furnishing flying training and recreational flying to club members;
- (7) *Specialty Air Carriers*—which operate for purposes not provided for by any other class such as aerial photography and survey, aerial distribution (crop dusting, pest control, seeding), aerial inspection, reconnaissance and advertising (forest, fire patrol, pipelines), aerial control (fire, water-bombing), aerial construction, and air ambulance and mercy services.

**INTERNATIONAL AIR CARRIERS—**

- (8) *International Scheduled Air Carriers*—are domestic and foreign air carriers designated by the Government of any State to operate international scheduled air services between Canada and any other State, pursuant to an international agreement to which Canada is a party; and
- (9) *International Non-scheduled Air Carriers*—are domestic and foreign air carriers which operate, between Canada and any other State, any commercial air service performed by domestic carriers in (2), (3), (4), (5) and (7).

**Canada's International Flag Carriers**

**Air Canada.**—High standards of technical excellence, coupled with a route network of 89,000 unduplicated route miles in domestic and international commercial air services extending to 58 destinations in Canada, the United States, the British Isles, Europe and the Caribbean have made Air Canada a major asset to the Canadian nation. The years 1969 and 1970, the 32nd and 33rd of Air Canada operations, were characterized by modest increases in passenger traffic. In 1970, traffic volume increased 16 p.c. in terms of scheduled passenger miles flown but it is estimated that if the strike effect (the International Association of Machinists and Aerospace Workers forced a one-month shut-down in 1969) were eliminated, the increase would be only 6 p.c. The load factor for the two years was the same at 57 p.c. In 1970, the Federal Government decision to adopt a floating Canadian dollar exchange rate on June 1 had an adverse effect on Air Canada income. Because of the tariff provision permitting payment in either currency, payment of fares by Canadians in United States funds increased substantially in the last seven months of the year. Accordingly, proceeds in terms of Canadian dollars were reduced.

Passengers carried on all services by Air Canada numbered 7,464,000 in 1970 and 6,563,000 in 1969, representing an increase of 13 p.c. Available seat-miles on scheduled services were up to 11,652,000,000 in 1970 from 10,058,000,000 in 1969 and revenue passenger miles on scheduled services reached 6,681,710,000 in 1970 compared with 5,740,299,000 in the previous year. Operating revenues in 1970 were up modestly to \$478,259,000 from \$404,652,000, of which passenger revenue on scheduled services was \$387,486,000, a slight increase over \$332,727,000 in 1969. An encouraging trend was strong growth in the company's Atlantic scheduled passenger traffic, which moved up 42 p.c. over 1969 as the market responded to lower fares and removal by the British Government of restrictions on travel allowances. Air freight revenues rose 25 p.c. and charter revenues reached \$14,378,000, an increase of 75 p.c. over 1969. The company suffered a net loss of \$1,072,000 in 1970 which compared with a net profit of \$1,548,000 in 1969. Return on investment dropped from 4.8 p.c. to 4.5 p.c.

During 1970, Air Canada took delivery of seven DC-8-63s and three DC-9s. The fleet consisted of 117 aircraft at year-end—38 DC-8s, 36 DC-9s, 12 Vanguards and 31 Viscounts. Jet travel accounted for 90 p.c. of seat-miles provided, compared with 85 p.c. in 1969.

## 1.—Operating Statistics of Air Canada, 1961-70

NOTE.—Some of the figures in this table have been calculated from the monthly reports of Air Canada but most of them are from the audited annual reports of the corporation; there are slight variations in a few of the figures but the degree of error is less than 1 p.c.

Year	Traffic				Operating Revenue			Operating Expenses	Operating Profit	Net Income or Loss (—)
	Revenue Passengers <sup>1</sup>		Revenue Com-mo-dity <sup>2</sup>	Mail	Passenger	Freight <sup>3</sup> and Mail	Total <sup>4</sup>

<sup>1</sup> Scheduled and non-scheduled services.

<sup>2</sup> Freight, express and excess baggage.

<sup>3</sup> Freight includes

express and excess baggage.

<sup>4</sup> Passenger, freight, excess baggage and mail, plus all other operating revenue.

**Canadian Pacific Air Lines Limited (CP Air).**—This private airline was established in 1942 by integrating 10 bushline air carrier companies and has since developed into a major national flag carrier for Canada. In 1970, CP Air carried 1,437,000 revenue passengers 21,601,006,000 passenger-miles. Operating revenues for the year reached \$150,000,000, an advance of 12 p.c. over 1969.

CP Air's network radiates from the company's system headquarters at Vancouver, serving Japan and Hong Kong over the Great Circle North Pacific Route; Holland over the Polar Route via Calgary and Edmonton; Honolulu, Fiji and Australia via the South Pacific Route; Portugal, Spain, Italy, Greece and Israel via Toronto and Montreal on the South Atlantic Route; Mexico, Peru, Chile and Argentina via Montreal and Toronto on the South American Route; and regular West Coast flights between San Francisco and Vancouver. The airline's operations in the Far East are extremely important to Canada's relations with the developing nations in that area. Within Canada, CP Air transcontinental air services link Vancouver, Edmonton, Calgary, Winnipeg, Toronto, Ottawa and Montreal, and the company also operates interior services in British Columbia and the Yukon Territory.

CP Air became an all-jet airline in 1969, operating 22 aircraft—seven Boeing 737s, four Boeing 727s and 11 DC-8s.

### Regional Airlines

**Eastern Provincial Airways (1963) Limited.**—This company is the regional carrier for the Atlantic Provinces. In 1970, it carried 239,628 revenue passengers 106,752,649 passenger-miles, and 6,098 tons of freight 2,041,572 ton-miles. Operating revenues were \$13,817,016, 17 p.c. higher than the 1969 revenues of \$11,800,000. Scheduled services are operated to Charlottetown and Summerside in Prince Edward Island; Moncton-Chatham-Charlo in New Brunswick; Sydney and Halifax in Nova Scotia; Deer Lake-Stephenville-Corner Brook, Gander, St. John's and St. Anthony in Newfoundland; Goose Bay, Wabush, Labrador City and Twin Falls-Churchill Falls in Labrador; and Montreal, Sept Îles and the Magdalen Islands in Quebec. In addition to its scheduled services lifting passengers and freight in the four Atlantic Provinces and in eastern Quebec, the airline provides air

services for mineral exploration, forestry, seal and ice patrol, aerial photography and for other purposes, thus making a significant contribution to the development of areas in Canada relatively inaccessible by surface transport.

The Company's fleet at the end of 1971 comprised three Boeing 737s, three Handley Page Dart Herald, two Carvairs, and four DC-3s.

**Nordair Ltée-Ltd.**—Nordair, with head office at Dorval, Que., was established in 1957 by the merger of Mont Laurier Aviation and Boreal Airways. Since its formation, Nordair has expanded steadily and operates scheduled services in Quebec, Ontario and the Northwest Territories, as well as extensive domestic and international charter flights throughout Canada and from Eastern Canada to southern United States and Caribbean islands.

Scheduled services are operated between Montreal, Ottawa, Hamilton and Pittsburgh and between Montreal and Great Whale and Fort Chimo in Quebec and Frobisher Bay and Resolute Bay in the Northwest Territories. Nordair also maintains an extensive air service based at Frobisher Bay in the Northwest Territories, supplying numerous Arctic settlements in the Baffin Island area, such as Clyde River—Cape Christian, Broughton Island, Pangnirtung, Cape Dyer, Cape Dorset, Coral Harbour, Hall Beach, Igloolik and Pelly Bay. In late 1971, applications were before the Air Transport Committee to extend Nordair's services to Windsor in Ontario and to Yellowknife in the Northwest Territories.

Nordair's charter flights accommodate inclusive tour travels and group travel. Nordair's northern charter operations are based at Fort Chimo and Frobisher Bay from which points a variety of aircraft, including wheel-, ski- and float-equipped aircraft, are available.

Nordair's fleet is composed of four Boeing 737-200Cs, five DC-3s, three C-46s, one DC-4, one F227-E, one Twin Otter, one Short Skyvan, one Beaver and one Mallard amphibious aircraft.

**Pacific Western Airlines Ltd.**—Pacific Western Airlines Ltd., with head office at Vancouver International Airport, operates over more than 11,000 route-miles; its services include scheduled mainline local regular unit toll and charter flights in British Columbia, Alberta, the Northwest Territories and Saskatchewan.

Regularly scheduled mainline services are operated north-bound from Edmonton to Prince George, Prince Rupert, Dawson Creek (B.C.); Peace River, Fort McMurray, Rainbow Lake, Fort Chipewyan (Alberta); Uranium City (Saskatchewan); Fort Resolution, Hay River, Fort Smith, Fort Simpson, Wrigley, Norman Wells, Inuvik, Yellowknife, Cambridge Bay and Resolute (Northwest Territories). The only no-reservations-required AirBus service in Canada operates daily between Calgary and Edmonton in Alberta. On the Pacific Coast, mainline services are operated from Vancouver to Comox, Powell River, Campbell River and Port Hardy. In the interior region of British Columbia, Pacific Western operates scheduled services from Vancouver to Kelowna, Penticton, Cranbrook, Kamloops and through to Calgary in Alberta. The company also operates international charter passenger services. Large aircraft charters are operated from the major centres of Vancouver, Edmonton and Calgary. Pacific Western operates extensive freight services, both scheduled and chartered, into the Northwest Territories. Three Lockheed Hercules provide charter freight services throughout the free world.

In 1970, 887,634 revenue passengers were carried, revenue passenger-miles totalled 530,525,064, cargo ton-miles were 26,595,383 and aircraft miles flown numbered 11,510,226. Comparable figures for 1969 were 704,039, 385,089,041, 18,710,463 and 9,446,652, respectively.

Aircraft operated by Pacific Western Airlines number 24, including: one Boeing 707, four Boeing 737s, five Convair 640 jet-props, three Lockheed Hercules (freight), three DC-6s, two DC-4s, two DC-3s, two Mallards and two Lockheed Electras (passenger and freight).

**Quebecair.**—Quebecair, with head office at Montreal, offers scheduled services in Quebec and Labrador. The company dates from 1946 and was founded under the name "Le Syndicat d'Aviation de Rimouski". In 1947, the name was changed to Rimouski Airlines and the company inaugurated an air transport service between the shores of the Gulf of St. Lawrence, linking Matane, Mont Joli, Rimouski, Forestville, Baie Comeau and Sept Îles. Until 1953, service was limited to towns and small centres located between Rimouski and Gaspé on the south shore of the St. Lawrence River and between Forestville and Sept Îles on the north shore. In 1953, with amalgamation of Gulf Aviation, the name "Quebecair" was adopted. With the expansion of mining and industrial activities, it extended its network to Quebec City and Schefferville in 1955, to Montreal in 1957, to Gagnon and Rivière du Loup in 1959, to Wabush in 1960, to Manicouagan and Saguenay in 1961 and to Murray Bay in 1962. During 1965, Quebecair acquired Northern Wings Limited and Northern Wings Helicopters Limited and merged their scheduled services. In 1967, Quebecair acquired A. Fecteau Transport Aérien Ltée, thus extending its operations to the Abitibi region and eastern bank of Hudson Bay.

Quebecair is responsible for the operation of the scheduled services and the subsidiaries handle flights by light aircraft, charter and contract services. Scheduled services are operated over 6,000 miles serving some 43 localities in nine economic regions of Quebec and Labrador. Points linked are Montreal, Quebec City, Murray Bay (Charlevoix), Baie Comeau (Hauterive), Churchill Falls (Twin Falls), Gagnon, Wabush (Labrador City), Mingan, Mont Joli-Rimouski, Rivière au Tonnerre, Saguenay (Bagotville), Schefferville, Sept Îles, Senneterre, Mistassini, Temiscaming, Lac Doda, Lac Caché, Lac Mistassini, Rupert River, Fort George, Obedjiwan, Oskelaneo, Manouane, Val d'Or, Amos, Lebel-sur-Quévillon, Rupert House, Chibougamau, Matagami, Blanc Sablon, Saint Paul, Old Fort Bay, St. Augustin, La Tabatière, Tête à la Baleine, Harrington Harbour, Gethsemani, Kégaska, Natashquan, Aguanish, Baie Johan Beetz, and Havre St. Pierre. Quebecair also operates group charters within Canada, to the United States, to the Caribbean, to Mexico and to South America, using jet aircraft.

Revenue passengers transported by Quebecair only in 1970 numbered 212,400 for 88,448,700 passenger-miles, and 2,350 tons of goods were hauled for a total revenue of \$9,314,900.

At the end of 1970, the combined fleet of Quebecair and its subsidiaries totalled 75 units, including: two BAC-1-11s, four F-27s, five DC-3s, one C-46, nine DHC-3 Otters, 19 DHC-2 Beavers, eight Cessna 180s, five Cessna 185s, one Dornier 28, one Beechcraft Queen Air, and 20 helicopters.

**Transair-Midwest.**—This company was formed in November 1969 through the merger of Transair Limited and Midwest Airlines Ltd., both of Winnipeg. With headquarters at the Winnipeg International Airport, the company operates scheduled services in Manitoba, Saskatchewan, Ontario and the Northwest Territories and charter flights throughout Canada and from Canada to the United States, Mexico and the Caribbean. The company's scheduled services are operated in four areas: (1) the Prairies—from Winnipeg to Regina-Saskatoon-Prince Albert and return; (2) Manitoba—from Winnipeg to The Pas-Flin Flon-Lynn Lake-Thompson and return; from Winnipeg to Gillam-Churchill and return; from Winnipeg to Thompson-Churchill and return; from Winnipeg to Norway House and return; from Winnipeg to Brandon and return; from Winnipeg to Dauphin-Yorkton and return; (3) Eastern—from Winnipeg to Thunder Bay-Toronto and return; from Winnipeg to Kenora-Dryden-Thunder Bay-Sault Ste. Marie-Toronto and return; from Winnipeg to Red Lake and return; and (4) Arctic—from Churchill to Eskimo Point-Rankin Inlet-Baker Lake and return; from Churchill to Coral Harbour-Repulse Bay-Hall Beach and return. Several other points in the Northwest Territories are also served by flights from Churchill.

The diversity of Transair-Midwest's aircraft fleet, which is comprised of 47 aircraft, including 14 helicopters, supports the company's claim of being Canada's "most versatile"

and "most complete" airline. The fleet ranges from small, single-engined aircraft equipped with wheels, skis or floats for access to remote hinterland and short-airstrip areas, to multi-engine aircraft, including two Boeing 737 twin jets and three Argosy 222 freighters capable of carrying 28,500 lb. Most of the fleet is stationed at Winnipeg but several turbo-prop and piston aircraft are usually positioned at the company's major base at Churchill, Man., in support of its Arctic and DEW-line operations. Since 1961, under contract with the United States Air Force, Transair has operated, from Winnipeg and Churchill, the vertical re-supply flights to the four main sites in the Canadian sector of the DEW-line in the extreme Arctic.

Major company developments in 1970 were: (1) the receipt of two Boeing 737 twin jets which operate in all passenger, or all cargo, or mixed passenger and cargo configurations; (2) the commencement on Apr. 26 of a daily Boeing 737 jet service on a new route from Winnipeg to Thunder Bay-Toronto and return; (3) the extension on the same date of service on a new route from Thunder Bay to Sault Ste. Marie-Toronto and return, of a previously operated Winnipeg-Kenora-Dryden-Thunder Bay service and the introduction of YS-11A equipment on the entire route on Apr. 26; (4) the introduction of Boeing 737 jet service from Winnipeg to the northern Manitoba points, The Pas, Flin Flon, Lynn Lake, Thompson and the provision of through jet service from these points to Thunder Bay and Toronto; (5) a marked upswing in passenger and cargo traffic to and from northern Manitoba.

During the first half of 1971 developments included: (1) the introduction of Argosy 222s into domestic charter service and the substantial increase in charters which they generated particularly in connection with oil and gas exploration in the high Arctic; (2) a rapid expansion of domestic and transborder charters, especially with Boeing 737 aircraft; (3) the retirement of DC-4 aircraft and the introduction of Boeing 737 jets on DEW-line charters; (4) the commencement of Twin Otter "Commuter Service" on Winnipeg-Brandon and return, Winnipeg-Dauphin-Yorkton and return, and Winnipeg-Red Lake and return routes; (5) the introduction of a twice weekly service from Red Lake to Toronto and return via intermediate points; (6) a marked improvement in the company's over-all financial condition.

In 1970, Transair flew 4,346,819 miles and carried 261,206 passengers for 113,000,000 passenger-miles, compared with 180,000 revenue passengers for 72,000,000 passenger-miles in 1969; 9,633 tons of goods were hauled for 4,527,000 ton-miles as against 9,432 tons for 5,000,000 ton-miles in 1969. Operating revenues of \$14,024,000 were 21 p.c. above the revenue of \$11,029,000 in 1969. Employees numbered 488, including 89 pilots.

### Commonwealth and Foreign Scheduled Commercial Air Services

At the end of 1970 there were 32 foreign air carriers holding valid Canadian operating certificates and licences issued for the following international scheduled commercial air services into Canada:\*

*Aeroflot*, operating between Moscow (U.S.S.R.) and Montreal (Canada).

*Aerlínte Éireann Teoranta* (Irish International Airlines), operating between Shannon (Ireland) and Montreal (Canada).

*Aeronaves de Mexico, S.A.*, operating between Mexico City (Mexico) and Montreal and Toronto (Canada) without local traffic privileges between Toronto and Montreal (Canada).

*Alaska Airlines, Inc.*, operating between Ketchikan (Alaska) and Prince Rupert (Canada).

*Alitalia—Linee Aeree Italiane*, operating between Milan (Italy), Montreal (Canada) and Chicago (U.S.A.).

*Allegheny Airlines Inc.*, operating between Erie (U.S.A.) and Toronto (Canada).

\* Points outside of Canada, which are named in licences but to which no traffic rights to or from Canada apply, are omitted; also omitted are services authorized by licences which are under suspension but not cancelled.

- American Airlines Inc.*, operating between New York/Newark (U.S.A.) and Toronto (Canada); between Chicago (U.S.A.) and Toronto (Canada); and between Los Angeles (U.S.A.) and Toronto (Canada).
- British Overseas Airways Corporation*, operating between London and Manchester (England) and Gander (Canada); Montreal and Toronto (Canada) and Chicago (U.S.A.) without local traffic rights between Canadian points but with full traffic rights between Montreal (Canada) and Chicago (U.S.A.); and between London (England), Prestwick (Scotland), Gander (Canada), Bermuda, Nassau (Bahamas), Montego Bay (Jamaica), Barbados and Trinidad.
- BWIA (British West Indian Airways)*, operating between Port of Spain (Trinidad), Antigua, Barbados and Toronto (Canada).
- Ceskoslovenske Aerolinie (Czechoslovak Airlines)*, operating between Prague (Czechoslovakia), Montreal (Canada) and New York (U.S.A.).
- Compagnie Nationale Air France (Air France)*, operating between Paris (France), Montreal (Canada) and Chicago (U.S.A.) via any one or more of the following: United Kingdom, Shannon (Ireland), Iceland, Azores.
- Deutsche Lufthansa Aktiengesellschaft (Lufthansa German Airlines)*, operating between Frankfurt, Cologne/Bonn (Germany) and Montreal (Canada); and between Frankfurt (Germany) and Montreal (Canada) restricted to a once-weekly cargo service.
- Eastern Air Lines Inc.*, operating between Washington (U.S.A.) and Montreal and Ottawa (Canada) direct or via the following intermediate points: Syracuse, Scranton-Wilkes-Barre, Allentown, Bethlehem, Easton, Reading, Lancaster, Baltimore and Endicott, Johnson City (U.S.A.) with no domestic rights between Montreal and Ottawa (Canada) except stopover privileges at Montreal on through traffic between Ottawa (Canada) and authorized points in the U.S.A. and stopover privileges at Ottawa on through traffic between Montreal and authorized points in the U.S.A.; between New York (U.S.A.) and Montreal and Ottawa (Canada) with no traffic privileges between Montreal and Ottawa (Canada) except stopover privileges at Montreal (Canada) on through traffic New York (U.S.A.) to Ottawa (Canada) and stopover privileges at Ottawa (Canada) on through traffic New York (U.S.A.) to Montreal (Canada); between Buffalo (U.S.A.) and Toronto (Canada); and between Tampa/Miami (U.S.A.) and Toronto (Canada).
- El Al Israel Airlines Ltd.*, operating between Tel Aviv (Israel), Amsterdam (Netherlands), Geneva (Switzerland), New York (U.S.A.) and Montreal (Canada).
- Hughes Air West, a division of Hughes Air Corporation*, operating between Spokane (U.S.A.) and Calgary (Canada).
- Japan Air Lines Company Ltd.*, operating between Tokyo (Japan), Vancouver (Canada), San Francisco (U.S.A.) and Mexico City (Mexico).
- Koninklijke Luchtvaart Maatschappij N.V. (KLM Royal Dutch Airlines)*, operating between Amsterdam (Netherlands) and Montreal (Canada).
- Lineas Aereas de España (Iberia Air Lines of Spain)*, operating between Madrid (Spain) and Montreal (Canada).
- Mohawk Airlines Inc.*, operating between Burlington (U.S.A.) and Montreal (Canada), and between Buffalo and Rochester (U.S.A.) and Toronto (Canada).
- North Central Airlines Inc.*, operating between Duluth/Superior (U.S.A.) and Thunder Bay (Canada), and between Detroit (U.S.A.) and Toronto (Canada).
- Northeast Airlines Inc.*, operating between Boston (U.S.A.) and Montreal (Canada) direct or via the intermediate points White River Junction, Montpelier/Barre and Burlington (U.S.A.), and between Tampa/Miami (U.S.A.) and Montreal (Canada).
- Northwest Airlines Inc.*, operating between Minneapolis (U.S.A.) and Winnipeg (Canada) via Fargo or Grand Forks (U.S.A.).
- Olympic Airways S.A.*, operating between Athens (Greece), Montreal (Canada) and Chicago (U.S.A.).
- Qantas Airways Limited*, operating between Sydney (Australia), Fiji Islands, Canton Island, Honolulu and San Francisco (U.S.A.) and Vancouver (Canada).
- Société Anonyme Belge D'Exploitation de la Navigation Aérienne (Sabena Belgian World Airlines)*, operating between Brussels (Belgium) and Montreal (Canada).
- Scandinavian Airlines System*, operating between Stockholm (Sweden), Oslo and Bergen (Norway), Copenhagen (Denmark) and Montreal (Canada).
- Seaboard World Airlines Inc.*, operating between New York, Philadelphia and Baltimore (U.S.A.) and Zurich (Switzerland) via Gander (Canada), Shannon (Ireland), Paris (France) and Basle and Geneva (Switzerland) for the carriage of mails and goods only; and between

New York, Philadelphia and Baltimore (U.S.A.) and Munich (Germany) via Gander (Canada), Shannon (Ireland) and (a) Glasgow (Scotland), London (England), Brussels (Belgium), Cologne/Duesseldorf, Frankfurt, Stuttgart, Nuremberg and Wiesbaden (Germany) and (b) Glasgow (Scotland), London (England), Amsterdam (Netherlands), Hamburg, Frankfurt, Stuttgart, Nuremberg and Wiesbaden (Germany) for the carriage of cargo only.

*Swissair (Swiss Air Transport Company Ltd.)*, operating between Zurich and/or Geneva (Switzerland) and Montreal (Canada).

*Transporter Aereos Portugueses S.A.R.L.*, operating between Lisbon (Portugal), Azores and Montreal (Canada).

*United Air Lines Inc.*, operating between Chicago (U.S.A.) and Toronto (Canada), and between Seattle (U.S.A.) and Vancouver (Canada).

*Western Air Lines Inc.*, operating between Denver and Great Falls (U.S.A.) and Calgary (Canada), and between Los Angeles/San Francisco (U.S.A.) and Vancouver (Canada) via Portland (U.S.A.).

*Wien Consolidated Airlines Inc.*, operating between Juneau (U.S.A.) and Whitehorse (Canada).

### Personnel Licences

At Mar. 31, 1971, the total number of personnel licences in force in Canada was 39,479, compared with 37,492 on the same date of 1970. The 1971 licences were constituted as follows, with comparable 1970 figures in brackets: glider pilots, 1,529 (1,356); private pilots, 25,237 (23,748); commercial pilots, 4,730 (4,677); senior commercial pilots, 744 (698); airline transport pilots, 2,792 (2,676); flight navigators, 211 (216); air traffic controllers, 1,025 (948); flight engineers, 93 (95); aircraft maintenance engineers, 3,113 (3,074); and gyrocopter pilots, 5 (4).

### Air Traffic Control

The primary functions of Air Traffic Control in the Ministry of Transport are to prevent collisions between aircraft operating within controlled airspace and between aircraft and obstructions on the manoeuvring area of controlled airports, and to expedite and maintain a safe, orderly flow of air traffic. These functions are carried out by Air Traffic Controllers situated in Airport Control Towers, Terminal Control Units and Area Control Centres. The services provided by these units are described below.

*Airport Control Service* is provided to aircraft operating on the manoeuvring area or in the close vicinity (5-10 nautical-mile radius) of civil airports where the volume and complexity of air traffic indicate its need in the interest of flight safety. Service is also provided to other traffic, such as vehicles and maintenance equipment, on the manoeuvring area of an airport. Radio is the prime means of communication in the provision of the service, although light signals may be used where radio is not available. Airport Control Towers are in operation at: Gander International, St. John's, and Wabush (Labrador) in Newfoundland; Halifax International and Sydney in Nova Scotia; Fredericton, Moncton and Saint John in New Brunswick; Baie Comeau, Cartierville, Montreal International, Quebec, St. Honoré, St. Hubert, St. Jean and Sept Îles in Quebec; Buttonville, Hamilton, London, North Bay, Oshawa, Ottawa International, Sault Ste. Marie, St. Catharines, Thunder Bay, Toronto International, Toronto Island, Waterloo-Wellington and Windsor in Ontario; Brandon, St. Andrews and Winnipeg International in Manitoba; Regina and Saskatoon in Saskatchewan; Calgary International, Edmonton International, Edmonton Industrial, Grande Prairie, Lethbridge and Springbank in Alberta; Abbotsford, Fort St. John, Kamloops, Kelowna, Langley, Penticton, Pitt Meadows, Port Hardy, Prince George, Vancouver International and Victoria International in British Columbia; and Whitehorse in the Yukon Territory.

*Terminal Control Service* is provided to aircraft which are 'climbing out' after departure from or 'letting down' for a landing at an airport. It is a service provided to such flights operating in accordance with the Instrument Flight Rules in order to separate them from

one another and from en route aircraft operating through the Terminal Area which normally is an airspace within 30-50 nautical miles of an airport and which, in some cases, may encompass more than one airport. Radar is normally used, in conjunction with direct controller-pilot radio communication, in the provision of this service. Procedural means are used at some remote locations where radar is not yet available. The service is provided from all Area Control Centres but separate Terminal Control Units are installed at high traffic density airports where no Area Control Centre is located. Such separate units have been established at Halifax in Nova Scotia; Quebec City in Quebec; North Bay, Ottawa and Thunder Bay in Ontario; Regina and Saskatoon in Saskatchewan; and Calgary in Alberta.

*Area Control Service* is essentially an aircraft separation and flight-following service provided to aircraft operating en route between airports. All flights that elect to file flight plans are given flight-following service, and separation is provided to all aircraft operating in accordance with the rules for instrument flight or controlled visual flight within designated controlled airspace, i.e., all airways below 23,000 feet above sea level (ASL) and all airspace in Canada south of 70° North latitude above 23,000 feet ASL. In addition, the service is provided north of 70°N to all aircraft operating above 29,000 feet ASL, and to aircraft operating above 5,000 feet over almost all of the western half of the North Atlantic Ocean. Separation is provided using both radar and procedural means, with direct and indirect communication between controller and pilot. An extensive land-line communication system links an Area Control Centre with all affiliated Airport Control Towers, Terminal Control Units and communication stations and with adjacent Area Control Centres in Canada and adjoining States, as well as with other agencies providing supporting and auxiliary services or having a need to deal directly with the centre, i.e., air carrier operation agencies, military operation agencies, etc. Additional services provided by Area Control Centres are:—

*Aircraft Movement Information Service* which assists the Department of National Defence in establishing the identification of all aircraft operating in specified areas.

*Customs Notification Service* which facilitates the notification of the appropriate customs agency by pilots planning to cross the Canada-United States border at certain designated customs airports. This service is provided when requested by a pilot in his flight plan.

*Alerting Service* which ensures that the appropriate search-and-rescue organization is notified of an aircraft which may be in need of its aid.

*Flight Information Service* which provides pilots with advice and information useful for the safe and efficient conduct of flight, including weather reports and forecasts, field condition reports, data concerning aids to navigation, traffic information and other information of use to the pilot in planning and conducting a flight.

Area Control Centres are located at Gander in Newfoundland; Moncton in New Brunswick; Montreal in Quebec; Toronto in Ontario; Winnipeg in Manitoba; Edmonton in Alberta; and Vancouver in British Columbia.

*Airspace Reservation Service* provides reserved airspace for specified operations within controlled airspace and information to other pilots concerning these reservations and military activity areas in controlled and uncontrolled airspace. The Airspace Reservation Coordination Office, located in Ottawa, is responsible for provision of the service in all the airspace of Canada and in the Gander Oceanic Control Area.

## Ground Facilities

Canadian aerodromes are listed in Table 2, classified by regions as licensed or unlicensed land facilities or seaplane bases, or military aerodromes. Licensed aerodromes are those that are inspected by Ministry of Transport inspectors at regular intervals and meet specific standards. In addition to aerodromes, a network of radio aids to navigation is maintained to facilitate en route navigation and safe landings under instrument conditions.

**Airport Activity.**—In 1970, aircraft movements at the 165 airports reporting such movements totalled 5,944,361, of which 1,397,197 were reported by airports without towers and 4,547,164 by the 52 airports with air traffic control towers (see p. 927). Of the latter, the 47 airports with Ministry of Transport towers registered 4,375,369 aircraft movements and the five Department of National Defence airports reported 171,795 movements.

The following chart shows the growth of aircraft movements at airports with Ministry of Transport towers during the decade ended in 1970.

For the third consecutive year, Toronto International Airport led in itinerant activity. Montreal International Airport retained second place after leading from 1964 to 1967. Vancouver and Winnipeg International Airports occupied third and fourth positions, respectively, in 1970, unchanged since 1965; Ottawa was in fifth place in both 1969 and 1970, replacing Cartierville which had been fifth from 1965 to 1968.

Rankings of the five leading airports in itinerant movements for 1966, 1968 and 1970 were:—

International Airport	1966		1968		1970	
	Rank	Itinerant	Rank	Itinerant	Rank	Itinerant
		No.		No.		No.
Toronto.....	2	119,493	1	153,336	1	176,611
Montreal.....	1	125,756	2	140,511	2	152,342
Vancouver.....	3	106,930	3	129,730	3	132,606
Winnipeg.....	4	96,619	4	109,268	4	117,949
Ottawa.....	6	76,121	6	87,350	5	89,169

At airports with air traffic control towers, aircraft weighing less than 4,000 lb. accounted for 46 p.c. of the itinerant movements in 1970 and those weighing over 39,000 lb. for 31 p.c. Aircraft in the heaviest weight group (over 314,000 lb. which includes the Boeing 747, the DC-8 30-to-60 series, the Ilyushin 62 and the Super VC-10), recorded a phenomenal growth from 41 itinerant movements in 1965 to 4,027 in 1967, to 29,666 in 1969 and to 44,853 in 1970.

In 1970, international movements rose 3.1 p.c. over 1969 to reach 205,268 and 58.3 p.c. of them were reported by Toronto and Montreal International Airports. Toronto handled 67,606, of which 59,033 were "transborder" (to and from the United States) and 8,573 were "other international" (to and from points outside Canada and the United States). Montreal International reported 52,069 international movements, of which 36,413 were transborder and 15,656 were other international.

According to the 1970 survey, 113 airports without towers handled 1,397,197 movements, 2.6 p.c. more than the 1,361,790 movements reported by the 108 airports in the 1969 survey. Itinerant movements were 418,236, up 5.3 p.c. over the 397,185 in 1969, and local movements, which were mainly training flights, numbered 978,961, 1.5 p.c. higher than the 964,605 movements in the previous year.

### Section 3.—Civil Aviation Operation Statistics

The statistics of commercial air services in Canada given in Table 3 cover foreign airlines (including those of the United States) and Canadian airlines that earned annual gross flying revenues of over \$100,000 in 1966-68 and over \$150,000 in 1969 and 1970. The figures for Canadian airlines cover both domestic and international operations; those for foreign airlines cover miles and hours flown only over Canadian territory and exclude passengers and goods in transit through Canada.

#### 3.—Summary Statistics of Commercial Air Services, 1966-70

NOTE.—Most of the figures in this table are from the audited annual reports of commercial air carriers; where preliminary figures have been used, there are occasional variations from the audited figures.

## PART V.—OIL AND GAS PIPELINES\*

**Oil Pipelines.**—Since the late 1940s large capital expenditures have been made each year for oil pipeline construction. In 1970, they were estimated at \$30,300,000 and were forecast at \$61,000,000 for 1971, raising the estimated cumulative total for the period 1950-71 to \$1,066,400,000.

The prime components of the network of Canadian oil pipelines are the trunks of the Interprovincial Pipe Line Company and the Trans Mountain Oil Pipe Line Company. The bulk of domestic crude oil is carried in these lines. Refineries that do not rely on these systems are located in the oil producing regions such as Calgary and Edmonton. The Interprovincial system carries crude oil eastward from Edmonton, receiving and discharging oil at various locations along its length. The Trans Mountain system operates similarly westward from Edmonton. Supplying these two trunk lines are pipeline systems funnelling oil from hundreds of fields into storage tanks at the pipeline terminals. Some of these feeder lines are impressive in themselves, not only in size of pipe and in length of route but in the volume of oil that they transport. Most of the feeder lines are in Alberta, which is to be expected because of the pre-eminent position of that province in oil production.

The main pipeline terminal at Edmonton has 10 crude oil feeder lines, including the Interprovincial extension to Redwater, as follows:—

<i>Pipeline</i>	<i>Total System Length</i>	<i>Capacity</i>	<i>General Area of Supply Related to Edmonton</i>
	miles	bbl./day	
Canadian Industrial Gas and Oil Ltd.....	82	15,000	southeast
Federated Pipe Lines Ltd.....	529	175,000	northwest
Great Canadian Oil Sands Limited.....	266	50,000	north-northeast
Gulf Alberta Pipe Line Company Limited	410	73,000	south-southeast
Imperial Pipe Line Co. Ltd.....	378	72,000	southwest
Interprovincial Pipe Line Co.....	31	110,000	northeast
Peace River Oil Pipe Line Co. Ltd.....	1,240	115,000	northwest
Pembina Pipe Line Ltd.....	931	180,000	west-southwest
Rainbow Pipe Line Company, Ltd.....	605	225,000	northwest
Texaco Exploration Company.....	173	130,000	south

In addition, three pipelines are connected to the Interprovincial at Hardisty, some 100 miles southeast of Edmonton. Here, Gibson Associated Oil Ltd. makes deliveries of up to 15,000 bbl. daily of oil from fields just south of the pipeline terminal. Husky Pipe Line Ltd. operates a multiple-line system in which one line is used to transport condensate from

\* Prepared in the Mineral Resources Branch, Department of Energy, Mines and Resources, Ottawa.

Hardisty to mix with the heavy, asphaltic crude found at Lloydminster. The condensate-crude blend is returned to Hardisty through eight- and 10-inch lines having a total capacity of 77,000 bbl. daily. The third pipeline connection—Bow River Pipe Line Ltd. with a capacity of 27,000 bbl. daily—carries crude from the most southerly oilfields in Alberta, near Taber. Home Oil Limited operates a pipeline serving refineries in the Calgary area with oil from fields north of the city; the line also has connections with the Rangeland pipeline which, in turn, is linked to the Texaco line going north to Edmonton. Also serving Calgary is the oldest pipeline in Alberta operated by Valley Pipe Line Company, which carries crude from the historically important Turner Valley in quantities up to 15,000 bbl. daily.

The Trans Mountain pipeline has a second receiving terminal in Alberta at Edson where the Peace River pipeline makes deliveries to Trans Mountain from fields to the north. In British Columbia, the Western Pacific Products and Crude Oil Pipelines Ltd. carries crude over a distance of 500 miles from fields near Fort St. John in the northeastern part of the province to the Trans Mountain pipeline at Kamloops; this line has a capacity of 66,500 bbl. daily.

Four main pipeline systems carry crude oil from Saskatchewan fields to the Interprovincial pipeline. The largest is the Westspur Pipe Line Company—Producers Pipelines Ltd. network, with a capacity of 175,000 bbl. daily, which delivers crude from the important southeast Saskatchewan producing area to the Interprovincial terminal at Cromer, Man., and also carries crude delivered to it by Trans-Prairie Pipelines Ltd. from fields in the Midale area of southeast Saskatchewan. In 1970, a twin line 100 miles in length was built for Murphy Oil Company Ltd. from Lone Rock in the Lloydminster field to Kerrobert, Sask., on the Interprovincial trunk line. A four-inch line carries the condensate from the Interprovincial pipeline at Kerrobert, Sask., to Lone Rock where it is blended with the heavy crude oil from the Lloydminster field to make it lighter and capable of being transported by pipeline. A 10-inch line returns the blend to Kerrobert pumping station where it enters the Interprovincial main line for transport east. The South Saskatchewan Pipe Line Company, with a capacity of 115,000 bbl. daily, takes medium-gravity crude from fields near Swift Current in southwest Saskatchewan to the Interprovincial pipeline at Regina. The fourth system is the Mid-Saskatchewan Pipeline of Gulf Oil Canada Limited, which has a capacity of 10,000 bbl. daily and carries oil from the Coleville-Doddsland area to the Interprovincial terminal at Kerrobert.

The Manitoba System of Trans-Prairie Pipelines Ltd. is the only pipeline in Manitoba serving the producing fields in the general area of Virden. It carries crude to the Interprovincial terminal at Cromer and has a capacity of 27,000 bbl. daily.

*Interprovincial Pipeline.*—The system of Interprovincial Pipe Line Company is Canada's longest oil pipeline. It incorporates the wholly owned subsidiary in the United States, Lakehead Pipe Line Company Incorporated, and has a right-of-way length of 2,025 miles including a 95-mile lateral to Buffalo, New York. In 1969, 170 miles of 34-inch pipeline were added in Western Canada, thus providing three complete lines between Edmonton and Superior, Wisconsin. In addition, 290 miles of 30-inch line were laid from the Chicago area to Sarnia, thereby providing two pipelines from Superior to Sarnia, one north of Lake Michigan and one to the south. The pipeline can deliver 30 grades of crude oil. Year-end capacities of the various sections of the pipeline are shown below for 1970 and for 1971.

<u>Section</u>	1970	1971
	bbl./day	bbl./day
Edmonton-Regina.....	1,001,000	1,027,000
Regina-Cromer.....	873,000	1,017,000
Cromer-Gretna.....	1,027,000	1,104,000
Gretna-Superior.....	983,000	1,104,000
Superior-Sarnia via Straits of Mackinae.....	538,000	538,000
Superior-Chicago.....	331,000	398,000
Chicago-Sarnia.....	306,000	306,000
Sarnia-Port Credit.....	287,000	316,000
Westover-Buffalo.....	90,000	90,000

Interprovincial serves 34 refineries: three at Edmonton; one at Lloydminster via the Husky pipeline; one at Saskatoon via Saskatoon pipeline from Milden; one at Moose Jaw via B-A Saskatchewan pipeline from Stony Beach; two at Regina; two at Winnipeg via Winnipeg pipeline from Gretna; 17 in the United States either directly or through connecting carriers; three at Sarnia; two at Oakville; one at Clarkson; and one at Port Credit.

*Trans Mountain Pipeline.*—The system of Trans Mountain Oil Pipe Line Company extends from Edmonton to Vancouver via Jasper and has a right-of-way length of 780 miles, including a section of 57 miles in the United States which belongs to a wholly owned subsidiary of Trans Mountain. Trans Mountain serves nine refineries: one at Kamloops; four at Vancouver; and four in the Puget Sound region of Washington State. Under a contract with Gulf Oil Canada Limited, facilities were completed at the Vancouver terminal to handle storage and transfer of liquid propane from railway tank cars to refrigerated Japanese tankers. First loading under the 10-year contract was made in October 1966 and, in 1970, 4,200,000 bbl. were delivered to tankers. Capacity of various segments of the system at the end of 1970 were:—

<i>Section</i>	<i>1970</i>	<i>Section</i>	<i>1970</i>
	<i>bbl./day</i>		<i>bbl./day</i>
Edmonton-Edson.....	310,000	Sumas-Ferndale.....	280,000
Edson-Kamloops.....	320,000	Sumas-Anacortes.....	270,000
Kamloops-Sumas.....	355,000	Sumas-Burnaby.....	335,000

*Montreal-Portland Pipeline.*—The Montreal refinery centre is served by a 236-mile pipeline which is a joint system of Montreal Pipe Line Company and its wholly owned subsidiary in the United States, Portland Pipe Line Corporation. This line takes delivery of tanker-borne crude from Venezuela, the Middle East and Africa at Portland, Maine. In 1965, the company completed a 24-inch pipeline alongside the existing 18-inch and 24-inch crude oil lines. An additional 24-inch line was completed under the St. Lawrence River in 1967 to serve the refineries in Montreal and, at the same time, 16- and 20-inch lines were installed for future use. Present capacity of the system is 514,000 bbl. daily.

*Product Pipelines.*—Traditionally, a product pipeline carries refined products from oil refineries to truck terminals in large consuming centres. However, with the growth of natural gas processing in Canada, which results in large volumes of products such as propane, butane and pentanes plus being produced, a new type of product line has emerged which carries these products to markets or to refineries.

There are three product lines in Eastern Canada, all supplying markets in Ontario with refined petroleum products. Two pipelines—Sun-Canadian Pipe Line Company and Sarnia Products Pipe Line—run from refineries at Sarnia to bulk plants in London, Hamilton and Toronto. Trans Northern Pipe Line Company, once a pipeline carrying products from Montreal to markets in Ontario as far west as Hamilton, now has a two-way flow. Products from Montreal are delivered only in the area east of Brockville, including the Ottawa Valley; products from refineries west of Toronto are carried eastward as far as Kingston.

In Western Canada, the Petroleum Transmission Company pipeline carries propane, butane and pentanes plus from a plant at Empress in Alberta to Winnipeg in Manitoba, a distance of 578 miles. The predominant product carried is propane which is also marketed at various locations along the line. Elsewhere in Alberta, the Rimbey Pipe Line Company transports condensate from the Rimbey gas plant and takes deliveries from the Rangeland condensate pipeline to serve areas north of Calgary as far as Edmonton. Also going to Edmonton from the Leduc gas conservation plant are three pipelines owned by Nisku Products Pipe Line Company Ltd., one each for propane, butane and pentanes plus. Near Calgary, Home Oil Company operates a condensate pipeline to serve refineries there and also to make deliveries to the Rangeland condensate pipeline. In 1969, a 186-mile, 8-12-inch pipeline was built by Dome Petroleum Limited to transport mixed natural gas liquids from

the Alberta Natural Gas Company's new gas reprocessing plant at Cochrane to Interprovincial's Edmonton terminal. The liquids are transported to plants at Superior, Wisconsin, and Sarnia, Ont., where they are fractionated into propane, butane and other products for use in the surrounding market areas. There are other condensate pipelines in Alberta, most of which are associated primarily with production and do not serve end-users.

On the Prairies a new pattern of distribution began to emerge with the completion of construction of Gulf Oil Canada Limited's major products pipeline system in Alberta during 1970. This 10-inch pipeline is 193 miles long and carries finished products from Gulf's new 80,000-bbl./day Edmonton refinery southward to terminals in Red Deer and Calgary. The remainder of the refinery's products slated for other Prairie Province centres are shipped via Interprovincial pipeline to terminals along the route. In this connection, Interprovincial is converting its original 20-inch line out of Edmonton exclusively to products and gas liquids, using the larger lines for crude oil.

*Pipeline Tariffs.*—Typical of the charges to move crude oil are the following pipeline tariffs:—

	<i>Charge</i>	<i>Distance</i>
	cts./bbl.	miles
Edmonton to Vancouver.....	40.0	718
Edmonton to Regina.....	20.7	438
Edmonton to Winnipeg.....	32.7	847
Edmonton to Sarnia.....	48.0	1,743
Edmonton to Port Credit.....	51.0	1,899
Portland to Montreal.....	11.0	236

**Natural Gas Pipelines.**—The authorization of large-volume gas removal from British Columbia and Alberta, beginning in the mid-1950s, led to the development of the first major gas transmission pipelines in Canada. These major lines provided the framework for the development of the extensive pipeline network which now serves most centres of population from Vancouver to Montreal, and transports gas for export at seven points along the Canada-United States border. Planning is under way to extend major transmission lines northward into areas not served by the existing system in order to transport gas from the Canadian Arctic islands and the Prudhoe Bay area of Alaska to southern markets. Three groups of companies have put forward proposals for such pipelines and substantial expenditures are being made on research programs aimed at assessing the technical problems and environmental effects of pipeline construction in the North. In order to assist companies in the initial planning phases, the Federal Government issued a set of guidelines outlining the criteria which must be met to protect the indigenous people and the northern environment during the construction and operation of the pipelines.

Pipelines are usually categorized under three headings—gathering lines, transmission lines and distribution lines. The gathering lines are those that take gas from the producing wells or separators to the field gate or some other delivery point. Transmission lines are normally the large-diameter pipelines that take gas from gathering lines and transport it to the distributors for delivery to the ultimate consumer. During 1970, capital expenditures of \$319,100,000 were made and expenditures of \$408,000,000 were forecast for 1971, bringing cumulative expenditures for the period 1955-71 to an estimated \$2,220,500,000 for gathering and transmission systems, with an additional \$1,321,400,000 for distribution systems. In total, there were 59,209 miles of pipeline in operation at the end of 1970, of which 6,829 miles were gathering, 18,663 miles were transmission and 33,717 miles were distribution.

Unlike oil pipeline companies which are common carriers that transport oil for a fixed charge, gas pipeline companies, with few exceptions, own the gas that is transported. The principal exception is the Alberta Gas Trunk Line Company which delivers virtually all of the gas exported from Alberta to the provincial boundary where main transmission companies accept delivery. This is an important exception because most of the Canadian gas reserves are in Alberta. The Alberta Gas Trunk system contains 3,246 miles of pipeline.

Some details of the main transmission systems are contained in the following paragraphs. Like oil pipelines, there are two trunk lines serving Canada. One is the Trans-Canada Pipe Lines Limited system and the other is that of Westcoast Transmission Company Limited.

*Trans-Canada Pipe Lines Limited.*—The Trans-Canada pipeline, originating at the Alberta border near Burstall, Sask., follows a route eastward to a point near Winnipeg, where it branches into two lines. One continues eastward into Ontario through Thunder Bay, then arches through the clay belt before swinging south via North Bay to Toronto, where one branch goes westward into Ontario and another follows the shore of Lake Ontario and the St. Lawrence River to Montreal and the United States border. A number of lateral lines extend from the main transmission line to serve communities along the route. The second line from Winnipeg goes south to the United States boundary at Emerson where it connects with the Great Lakes Gas Transmission Company system, which is jointly owned by Trans-Canada and an American company. This pipeline follows a route south of Lake Superior through the Straits of Mackinac and east of Lake Michigan to reconnect with the Trans-Canada system at Sarnia, Ont. The Trans-Canada system is Canada's longest pipeline, having a total length of 3,797 miles including loop lines. The maximum daily gas delivery through the system in 1970 was 2,696,000 Mcf. Export sales averaged 573,000 Mcf. daily.

*Westcoast Transmission Company Limited.*—The supply of gas for Westcoast comes mainly from fields in northeastern British Columbia but significant quantities are gathered in northwestern Alberta. The main line from Fort St. John runs in a southerly direction to Vancouver and to the United States border at Sumas, B.C. An extension to its system from the Fort St. John area to the Fort Nelson area permits the pipeline system to pick up gas from the main areas stretching from Dawson Creek to the Kotcho Lake area, north-east of Fort Nelson. Total pipeline in the Westcoast system exceeded 1,500 miles in 1970.

*Alberta Natural Gas Company.*—Although the Alberta Natural Gas pipeline is only 107 miles long, it forms a vital link in a major gas export scheme which carries Canadian gas as far south as California. The pipeline connects with Alberta Gas Trunk pipeline at Crowsnest Pass on the Alberta border and extends across southeastern British Columbia to the international border near Kingsgate where it meets the Pacific Gas Transmission Company system, which transports the gas in the United States.

*Other Gas Pipelines.*—There are many other natural gas pipelines operating in Canada. Some systems are devoted exclusively to gathering gas in producing fields, while others receive gas from the main transmission lines and distribute it to gas customers. Several large systems combine elements of gathering, transmission and distribution. Among the larger systems, Inland Natural Gas Co. Ltd. distributes gas to a number of centres in interior and southern British Columbia. In west-central British Columbia, the Pacific Northern Gas Ltd. pipeline services communities and industries along a 435-mile route between the Westcoast main line at Prince George and the Pacific Coast cities of Prince Rupert and Kitimat. Canadian Western Natural Gas Company Limited and Northwestern Utilities, Limited serve markets in central and southern Alberta with a total of more than 8,200 miles of pipeline. The Saskatchewan Power Corporation delivers all gas sold in Saskatchewan; the 6,483-mile system transports and distributes gas to most of the populated areas of Saskatchewan. The Northern and Central Gas Corporation Limited has probably the most geographically widespread distribution system in Canada, as it distributes gas to industries and communities adjacent to the Trans-Canada system from Winnipeg as far east as the Montreal area. Two large utility companies serve the highly populated and industrialized areas of southern Ontario—the Consumer's Gas Company operates in the Toronto area, the Niagara peninsula and eastern Ontario while the Union Gas Company of Canada, Limited serves the southwestern corner of the province. These and many other systems make up the growing network of gas pipelines which serves domestic, commercial and industrial customers in all provinces except Prince Edward Island, Nova Scotia and Newfoundland.

**Oil Pipeline Statistics.\***—There were 40 oil pipeline companies operating in Canada at the end of 1970. Pipeline deliveries shown in Table 1 were made to non-pipeline carriers, foreign pipelines, and terminals including refineries and distribution centres.

Revenue and employee data shown in Table 2 are not complete; both revenue and employee figures have been omitted for some companies, since pipeline operation forms only a part of the activities of these establishments and the data are not separable. Daily average of net deliveries by trunk lines in 1970 was 2,086,075 bbl.; trunk lines barrel-miles amounted to 367,766,218,000 and the average miles per bbl. to 483.

\* Statistics of oil pipelines are given in greater detail in Statistics Canada monthly report *Oil Pipe Line Transport* (Catalogue No. 55-001).

<sup>1</sup> Includes 2,668 miles of gathering lines within producing fields; these data were not available for previous years.

**Gas Pipeline Statistics.**—As already stated, the natural gas transport industry became a significant factor in the Canadian economy in 1957 with the completion of the first of several extensive pipelines constructed to transport natural gas from the field or processing plant to distribution outlets. Consequently, the distribution industry also greatly increased deliveries to consumers from that time. Table 3 illustrates this expansion for the years 1967-70.

## PART VI.—GOVERNMENT PROMOTION AND REGULATION OF TRANSPORTATION

The Federal Government plays a twofold role in the development of transportation services. One is the promotional role, ensuring the growth and development of the kind of transportation appropriate to the times; the other is a regulatory role, including economic regulation of rates and services and also technical regulation to meet safety requirements and for other purposes. Examples of promotion are the building of canals from the time of Confederation to the recent constructing of the St. Lawrence Seaway, the underwriting of railway development and branch-line extension, the establishment of Air Canada, the large investments in airports and aeronautical installations, and the building of the Trans-Canada Highway.

The Ministry of Transport and the various Crown agencies reporting to Parliament through the Minister of Transport have jurisdiction over canals, harbours, shipping, civil aviation and interprovincial and international railways. Interprovincial or international pipelines for carrying gas, crude oil or petroleum products are under the jurisdiction of the National Energy Board. Jurisdiction over for-hire interprovincial or international highway transport also rests with the Federal Government but these powers are at present exercised by the provincial highway transport boards under the federal Motor Vehicle Transport Act of 1954 (RSC 1970, c. M-14).

Railway regulation was developed in a period when railways enjoyed a virtual monopoly of transport in the country. Measures to protect the public against excessive charges, unjust discrimination and other objectionable monopoly practices, together with measures to ensure safe operations, have over the years subjected railways to the most comprehensive regulation of any Canadian industry. In the intervening years the rapid growth of road, air and pipeline services has ended the railway monopoly for a large part of the total traffic available and has placed the railways in a highly competitive situation.

A Royal Commission was appointed in 1959 to inquire into the railway rate structure and other problems. Its findings indicated a need to shift from regulating monopoly to maintaining a balance between the several competing modes of transport. Legislation based on the findings of the Royal Commission was passed by Parliament and received Royal Assent on Feb. 9, 1967. The statute, called the National Transportation Act, defines a national transportation policy for Canada looking to the achievement of an economic and efficient transportation system making the best use of all available modes of transportation at the lowest total cost. It established the Canadian Transport Commission to carry out the functions formerly performed by the Board of Transport Commissioners for Canada, the Air Transport Board and the Canadian Maritime Commission. In addition, the Act creates a framework within which the pipeline carriage of commodities other than oil and gas and the interprovincial and international motor transport undertakings can be regulated by the Canadian Transport Commission.

The general purpose of the Act is to create a situation in which the development of the transportation industry and the protection of the public against excessive or discriminatory charges are accomplished in the main by competition between modes rather than by regulation and control. The railways are relieved of some of the more onerous and outdated restrictions on their freedom to meet competition. On the other hand, a shipper who has no practical alternative to rail shipment can apply to have a maximum rate fixed for his goods by the new Commission. The Act also provides a procedure to allow the railways, under safeguards for the public interest, to abandon lines and withdraw passenger services where they are no longer needed.

**The Canadian Transport Commission.**—The Commission, created by the National Transportation Act (RSC 1970, c. N-17), was organized on Sept. 19, 1967 and succeeded to all the powers and duties of its predecessors, the Board of Transport Commissioners for Canada, the Air Transport Board and the Canadian Maritime Commission. The Commission is a court of record. It consists of a maximum of 17 members, of whom one is president and two are vice-presidents. One of the vice-presidents is charged with the superintendence of the work of the committees of the Commission and the other is charged with the superintendence of the programs of study and research of the Commission. For the purpose of performing its duties the Commission must establish committees, any of which may, in accordance with the rules and regulations of the Commission, exercise the powers of the Commission. Three of these committees—the Railway Transport Committee, the Air Transport Committee and the Water Transport Committee—are at

present functioning in respect of these several modes of transport. The finding or determination of the Commission upon any question of fact within its jurisdiction is binding and conclusive and no order or decision may be questioned or reviewed except on appeal to the Supreme Court of Canada upon a question of law or a question of jurisdiction with leave of that Court, or by the Governor in Council. However, a party to an application for a licence under the Aeronautics Act or the Transport Act may appeal to the Minister of Transport from a final decision of the Commission.

The Commission has jurisdiction under more than a score of Acts of Parliament, including the Railway Act, the Aeronautics Act and the Transport Act, over transportation by railway, by air and by inland water, and over communication by telephone and telegraph.

*Railway Transport.*—Under the Railway Act the jurisdiction of the Commission is, stated generally, in respect of construction, maintenance and operation of railways that are subject to the legislative authority of the Parliament of Canada, including matters of engineering, location of lines, crossings and crossing protection, safety of train operation, operating rules, investigation of accidents, accommodation for traffic and facilities for service, abandonment of operation and uniformity of railway accounting. The Commission also has certain jurisdiction over telephones and telegraphs, including regulation of the telephone tolls of Bell Canada and over tolls for the use of international bridges and tunnels.

Except for certain statutory rates, and subject to certain powers of the Commission to deal with rates that it finds to be contrary to public interest, the railways are free to charge rates as they wish. However, rates must be compensatory, and the Commission may prescribe tolls for captive shippers if such tolls take undue advantage of a monopoly situation favouring the railways.

*Air Transport.*—The Commission is responsible for the economic regulation of commercial air services in Canada and is also required to advise the Minister of Transport in the exercise of his duties and powers in all matters relating to civil aviation. The regulatory function relates to Canadian air services within Canada and abroad and to foreign air services operating into and out of Canada. It involves the licensing of all such services and the subsequent regulation of the licensees in respect of their economic operation and the provision of service to the public. The Commission issues regulations dealing with the classification of air carriers and commercial air services, accounts, records and reports, traffic tolls and tariffs, and various other matters. All regulations, rules and orders issued by the former Air Transport Board continue in force until repealed or amended by the Canadian Transport Commission.

On Oct. 20, 1966, the Minister of Transport tabled in the House of Commons a "Statement of Principles for Regional Air Carriers", which assigns to the Commission the responsibility for initiating measures to implement the policy set out therein. In this connection, the Commission has under review the route structures of regional air carriers.

The Commission takes an active part in the work of the International Civil Aviation Organization and, when appropriate, undertakes bilateral negotiations for the exchange of traffic rights. At present, Air Canada and CP Air are Canada's designated international scheduled carriers.

*Water Transport.*—Under the Transport Act, the Commission entertains applications for licences for ships to transport goods or passengers for hire or reward between places in Canada on the Great Lakes and on the Mackenzie and Yukon Rivers, except goods in bulk on waters other than the Mackenzie River. Before granting a licence, the Commission must be satisfied that public convenience and necessity require such transport. The Commission also has regulative powers over tolls for such transport.

*Shipping Subsidies.*—The Canadian Transport Commission also administers subsidies paid by the Federal Government for the maintenance of certain coastal and inland water

shipping services. The following statement shows the net amount of steamship subventions paid in connection with contracts made for the maintenance of essential coastal and inland water shipping services in the year ended Mar. 31, 1971.

**The National Energy Board.**—The National Energy Act (RSC 1970, c. N-6) proclaimed Nov. 1, 1959, provided for the establishment of a five-member Board charged with the duty of assuring the best use of energy resources in Canada. In the performance of this function, the Board is responsible for the regulation of the construction and operation of the oil and gas pipelines that are under the jurisdiction of the Parliament of Canada, the tolls charged for transmission by oil and gas pipeline, the export and import of gas and the export of electric power, and the construction of the lines over which such power is transmitted. The functions and operations of the Board are covered in the Domestic Trade and Prices Chapter, pp. 1037-1038.

### Section 1.—Telecommunications

#### Subsection 1.—Telecommunications Media\*

Communications in Canada have been shaped to meet the needs of the country. Great networks of telephone, telegraph, radio and television facilities, inextricably bound together, provide adequate and efficient service which, in the era of electronic advancement, is under continual technological change and development. The familiar challenges of the country—its size, its topography, its climate, its small population—which have reared their heads in other areas of development, have had to be faced as well in the field of telecommunications. That these have been met is evidenced by the fact that today Canada possesses communications facilities and services which are second to none in the world and which are somewhat unique in structure. On the one hand there is a group of telephone companies acting in concert to provide national services and on the other there are two railway companies providing services, each of which is national in scope. These companies provide a most comprehensive total telecommunications network and almost all Canadians from the Arctic Coast to the 49th parallel and from St. John's in Newfoundland to Victoria in British Columbia can communicate with each other and with the rest of the world by the simple action of twisting a dial or pushing a button. Messages are carried by microwave, tropospheric scatterwave systems, land lines and high frequency radio bands.

The major telecommunications carriers in February 1972 established the Canadian Telecommunications Carriers Association to provide the framework for greater co-operation and an industry-wide approach to meeting new objectives in today's rapidly changing telecommunications environment. The Association consists of 23 founding telecommunications carrier organizations, each of which is represented on the Board by a senior officer. It brings together for the first time in one organization the 13 members of the Telephone Association of Canada, Canadian National and Canadian Pacific Telecommunications, Canadian Overseas Telecommunication Corporation, Telesat Canada, The Trans-Canada Telephone System, The Canadian Independent Telephone Association and four other telephone companies.

\* Revised by Canadian National Telecommunications, Ottawa.

The vital importance of telecommunications in Canada was recognized in the creation of the federal Department of Communications in 1969. This brought together into a single ministry the Telecommunications Policy and Administration Bureau (formerly with the Department of Transport), the Defence Research Telecommunications Establishment and the Canadian Overseas Telecommunication Corporation. Initially the Department concerned itself with a comprehensive inquiry into all aspects of Canada's information system. The "Telecommission" study, completed in the spring of 1971, will provide the Department with guidance in the formulation of national communications policies and programs. Supplementing the Telecommission is the Canadian Computer/Communications Task Force which has been charged to develop concrete plans for an integrated network of Canadian computer utilities designed to bring the benefits of computer power to all Canadians. These plans will be submitted to the Canadian Government early in 1972 to form the basis of impending legislation. The marriage of computing technology with the technology of telecommunications has been the latest innovative phase and has allowed computers to "talk" to other machines or to each other through communications links. Since then, the concept of multi-user sharing of a central data processing complex has been rapidly winning acceptance. The Department has also sponsored projects to help high schools and universities to use the latest communications and computer systems for exploring computer-assisted learning. One such project is CANUET, a study being conducted by Canadian universities to see if it is possible to design a computer-communications network to serve the collective needs of all or most universities.

Because of growing computer-communications requirements, the Trans-Canada Telephone System announced in March 1971 the building of a nation-wide digital communications system which is designed to directly link computers from coast to coast. Their system is to be built in three stages with the final phase being completed in 1976 at a cost of \$100,000,000. The first stage, to be completed in 1972 from Halifax to Vancouver, will be a digital system using existing transmission equipment. The second phase will be a high-capacity buried coaxial cable from Quebec to Windsor to be built between 1974 and 1976. The third stage is another digital system using existing microwave networks to add to the capacity of the first-stage coast-to-coast network. The Trans-Canada Telephone System has developed a mini-computer-based sub-system called SCCS (Software Controlled Communications Services) to act as translator between the network and the customers' computers. It will give data to the customer in whatever form he requires and it will accept data in any format irrespective of speeds or codes used. CN-CP Telecommunications will also convert portions of their transcontinental microwave system to digital systems, on a gradual basis. Most present transmission facilities are analogue or voice networks.

Another vital concern of the Department of Communications is the extending of communications to remote communities. The Department announced in 1970 that particular attention would be given to greater involvement of residents of remote communities in communications programs and projects. They proposed to open a permanent office in the Northwest Territories to ensure that planning and initiatives of telecommunications companies were developed in harmony with the desires of the residents of that region. One such program, called Comminterphone (Community Interaction Telephone), is under way for the Northwest Territories community of Rankin Inlet, more than 300 miles north of Churchill in Manitoba. It is a joint project of the Department of Communications, the Canadian Broadcasting Corporation, Bell Canada, and Bell-Northern Research Laboratories. Originally conceived by Bell-Northern Research Laboratories, Comminterphone will enable residents to share and exchange their feelings through the telephone to a CBC low-power relay transmitter which will broadcast in the AM radio band within a five-mile radius. Residents will be able to listen to their neighbours on the radio and, if they wish to express views, they simply dial a special telephone number to connect them into the radio broadcast.

**Public Telephone Service.**—Telephone service, local and long-distance, is provided by the telecommunications companies serving a total of 10,000,000 telephones across Canada, or almost one telephone for every two Canadians. The largest serving organization is the Trans-Canada Telephone System comprising eight telephone companies, either privately or publicly owned—the Newfoundland Telephone Company Ltd., the Maritime Telegraph and Telephone Company Ltd., The New Brunswick Telephone Company Limited, Bell Canada, the Manitoba Telephone System, Saskatchewan Telecommunications, Alberta Government Telephones and the British Columbia Telephone Company. In addition, there are almost 1,900 independent telephone companies providing private service in smaller communities across the country, many of which link into the Trans-Canada Telephone System for world-wide telephone access. Each company has a monopoly within its own territory and is subject to government regulations at the appropriate level—federal, provincial or municipal.

CN Telecommunications, the largest single system in Canada on the basis of area served, provides telephone service for residents in the Yukon and Northwest Territories, in parts of Newfoundland and in northern sections of British Columbia. In all, there are some 41,000 subscribers on the CNT telephone network. Without exception, all CNT exchanges are of the automatic dial type. Subscribers in the Far North have access to the outside world via CNT-operated long-distance toll centres at Whitehorse, Y.T., Fort Nelson, B.C., and Hay River and Inuvik, N.W.T. In some areas, such as the Mackenzie River delta, long-distance calls are handled by automatic toll ticketing similar to that used by the large telephone companies in the major southern Canadian centres. Plans are being carried out to bring Direct Distance Dialling service to the CNT telephone areas in northwest Canada in 1972 and to their telephone areas in Newfoundland in 1973.

The latest telephone innovation is the electronic switching system and the touch-tone telephone. The dial is replaced by push-buttons, each of which, when pressed, emits a tone that activates the exchange to contact the desired party. Electronic exchanges are now being used in many areas by the Trans-Canada Telephone System and CN-CP Telecommunications are using a similar touch-tone application in their Broadband Exchange Service (see p. 947).

**Public Telegraph Service.**—Canada's telegraph systems are operated by CN-CP Telecommunications. These companies operate telegraph offices, often amalgamated, in all 10 provinces and in the Yukon and Northwest Territories, and messages can be sent to and from any point in Canada or throughout the world via the overseas cable services (see pp. 960-962). At one time, much of the CNT and CPT revenue came from telegraph message traffic but the proportion now accounted for by such traffic is only about 10 p.c. Even so, the reduced telegraph message traffic is handled by the most up-to-date facilities. Messages are transmitted by teleprinter and facsimile equipment, and telegraph networks over which public messages flow are controlled by computers. In other words, messages are taken in and forwarded automatically in accordance with special programs stored in the computer's memory. The computer determines where the message is to be sent and sends it as soon as the circuits are free.

A recent (1970) experiment by CNT using cathode ray tube displays (CRT) in Toronto proved so successful that CRT display units will be installed during 1972 at the larger centres of Edmonton, Winnipeg, Ottawa, Quebec City, Saskatoon, Moncton and Halifax. Eventually, units will be installed in all medium-sized centres and the Toronto centre will be expanded to include four more displays, bringing the total to 16. Basically, CRT displays have television-like screens placed above a keyboard similar to a typewriter which is connected to the message-switching computer. As the operator receives a telephoned telegram message, she types it on the keyboard and it appears on the screen at the same time. She is able to read the message back to the caller and, with editing capabilities built into the displays, may make changes to the text if required. When the message is confirmed, the push of a button sends it into the message-switching computer for transmission to its destination.

**Telex Service.**—Telex, by far the largest teletypewriter service in Canada, is provided by CN-CP Telecommunications. Its network of 22,000 subscribers in Canada interconnects with the Western Union Telex network in the United States and with European and world-wide networks of more than 380,000 subscribers. Telex is a direct distance dial teleprinter system which permits a subscriber to directly dial any other subscriber on the network. A multiple address service was offered to Telex users in 1971 through CNT's message-switching computer complex located in Toronto.

TWX, similar to Telex, is provided by the major telephone companies. One transmission speed of 100 words a minute is offered on this service, the network for which consists of some 3,000 subscribers in Canada and interconnects with the United States network of more than 50,000 TWX subscribers and also with the European and world-wide Telex network outside the North America network.

A medium-speed Telex service is offered exclusively by CN-CP Telecommunications, operating in the speed range of 100 and 250 words a minute. The subscriber may own his computer or data sending-receiving equipment or he may lease it from CN-CP. This service provides a direct dial interconnection with subscribers anywhere in Canada to achieve a medium-speed range transfer of data from one location to another. The monthly rates to subscribers are the same as the standard-speed Telex service, that is, based on time used and distance. A six-level code, an eight-level code and punched computer cards can operate on the medium-speed service.

**Broadband Exchange Service.**—In 1967, CN-CP Telecommunications introduced an automatic switching system of the most advanced design, known as Broadband Exchange Service, which has moved Canada into a new era of extremely high-quality and very rapid communications. It is the first such system to operate in Canada and the second in the world. Broadband has more than tripled the fastest conventional machine-to-machine transmission. Furthermore, it has the capability, upon customer demand, of transmitting computer data at 51,000 words a minute, or more than 50 times faster than the top speed reached by conventional switched networks. The Royal Canadian Mounted Police was the first organization to be tied into this supersonic network, using it for intricate and high-quality transmission of fingerprints, photographs and documents between headquarters at Ottawa and divisional headquarters at Montreal, Toronto, Winnipeg, Edmonton, Regina, Vancouver, Fredericton, Halifax and St. John's.

The name, Broadband Exchange Service, is derived from the actual system since it is designed to permit various bandwidths, depending upon their communications needs. The broader the bandwidths, the faster the speed of transmission. CN-CP will offer four bandwidths: four and eight kilocycles for voice, facsimile and data (from 1,000 to 3,000 words a minute); 16 kilocycles for high fidelity radio program transmission and facsimile; and 48 kilocycles for high-speed computer-to-computer data exchange (51,000 words a minute) and high speed for facsimile. The four-kilocycle bandwidth is now operational and the other bandwidths will become available upon customer demand.

Transmission is carried by the CNT-CPT microwave system using frequency diversity techniques to provide a high degree of reliability. In other words, the transmission is carried twice both ways over different circuits at the same time, one being the back-up system for the other.

Each subscriber has in his office a voice-data subset—a most advanced telephone instrument which, with the flick of a button, can change from voice communication to transmission of computer data. The subset features push-button “dialling” and the customer, to reach a distant point, simply pushes the buttons in a series of seven digits. The first three digits pressed designate the distant exchange, the fourth digit indicates the desired bandwidth and the last three digits are for the line of the desired party. A re-ring button is included so that the customer may signal the distant party to revert to voice communication during or after sending computer data. A feature of Broadband is abbreviated keying, where customers may contact frequently called stations by pushing a

two-digit code instead of the normal seven. Broadband will make distant connections, including keying time, within five seconds, or two seconds on the special "hot-line" service. Actual connection time after keying or "dialling" is less than two seconds. Another feature of Broadband is conference calling, where a subscriber, by pushing a two-digit code, will automatically contact a pre-determined list of parties needed for the conference. Subscribers are charged on a "pay-as-you-use" basis.

**Multicom Service.**—This service, offered by the Trans-Canada Telephone System beginning in 1969, is a medium-to-high-speed data transmission system designed for the data processing industry. It transmits data at a variety of speeds from 2,400 to 50,000 bits a second—or as high as 60,000 words a minute. Transmission speeds can be increased as the need becomes evident. The data may be prepared in the form of either punched cards, punched paper tape, magnetic tape, disc storage or facsimile for optical scanning. As in Broadband Exchange Service, the caller presses the first three numbers to identify the serving office and the class of service; the last four digits identify the station being called. The initial system is made up of three high-speed switching centres at Calgary, Toronto and Montreal and five medium-speed switching centres at Vancouver, Calgary, Winnipeg, Toronto and Montreal. These switching centres are located in existing telephone switching centres but are more sophisticated than the regular telephone exchanges.

**Data-Phone Service.**—The major Canadian telephone systems provide Data-Phone Service which transmits data from punched cards, tape or magnetic tape between two or more machines or computers. It takes pulses from punched cards or tape-data machines and transforms them into tones which are sent over telephone circuits or leased private lines. The subscriber pays for the line used at regular long-distance rates. Data-Phone transmits at a speed of 1,200 bits a second or 1,000 words a minute.

**Data-Line Service.**—Data-Line Service was put into operation by the Trans-Canada Telephone System in late 1968, primarily for customers who wished to be connected to time-sharing computers. Using the normal telephone lines and exchanges, this service has the capability of transmitting computer data from 1,000 words a minute to a new offering in 1969 of 50,000 words a minute. The subscriber may use his own send-and-receive equipment or he may lease the equipment from the Trans-Canada Telephone System. Charges are based on a flat rate and depend upon the bandwidth used.

**Wide Area Telephone Service.**—Wide Area Telephone Service (WATS), operated by the Trans-Canada Telephone System, provides dial-type telephone communication from one WATS zone directly to another long-distance zone. In other words, the subscriber has a wider area that he may call directly without going through the long-distance operator or Direct Distance Dialling, and he may select any or all of the WATS zones he wishes. The customer has an access line to a dial exchange office for use only in originating WATS calls. INWATS, the reverse series to WATS, was introduced in 1969. Subscribers are charged a measured time-period rate and an additional hourly rate. The measured time-period is 10 hours of accumulated time in each month and the additional hourly rate applies to the time used above the measured time.

**Hot-Line Service.**—A new service offered in 1969 by CN-CP Telecommunications and Western Union is the Hot-Line Service where companies in Toronto or Montreal may talk to their offices in New York City by simply picking up the handset of the telephone. When a customer picks up his handset, the exchange equipment will seek out the proper telephone at the other end. If all the circuits are in use at the time of calling, the caller will hang up and as soon as a circuit is free the equipment will make the connection and ring the telephone set at each end. Subscribers are charged on a time-used basis.

**Private Wire Teletype Systems.**—A transformation has been gradually taking place in private wire systems. Most major Canadian firms with large communications require-

ments in years past found that private wire systems best suited their needs—that is, their own private teletype network rented to them by telecommunications companies. Although private wire services are still a significant part of business for the telecommunications industry, prime communications users who must communicate with many stations across the country have been moving to the newer computer-controlled transmission systems.

**Computer-Controlled Transmission Systems.**—CNT-CPT and the Trans-Canada Telephone System all have in operation store-and-forward message-switching computers which control the flow of message traffic. CNT pioneered in the uses of message-switching computers in Canada, having operated in this field since 1964. Trans-Canada Telephone System inaugurated a computer-controlled system in late 1968 and CPT put their system in operation in 1970. The telephone companies have switching centres located at Vancouver, Calgary, Edmonton, Regina, Winnipeg, Montreal and at Toronto, their primary centre. This computer-controlled system converts transmission codes and speeds and also determines where messages are to be sent.

CNT's system provides a switching medium for Air Canada, CP Air and CN administrative message traffic and also controls and transmits information on CN's reservation system. When a railway customer wishes to make a reservation, a computer card is marked and inserted into a card reader. Within seconds, a reply will return via a teleprinter confirming the reservation. Air Canada's "Notice to Airmen" (NOTAM) project is also handled by this system; particular flight plans, runway conditions and navigational aids are stored in Air Canada's computer and given out to pilots across the country when a special code is dialled on teletype machines. A third-generation computer installed for CNT in 1968 is performing major store-and-forward message-switching functions for the Atmospheric Environment Service. When the computer finds a weather report from any of the 500 weather stations throughout Canada, it will tell the station equipment to transmit the report into the computer and it then determines where and at what time of the day the information is to be sent.

Commercial telegrams are switched across the country by CNT's third-generation message-switching computer complex. This undoubtedly is the most important development in telegraph service since Morse.

A new time-shared, computer-directed data and message system called Telenet was introduced by CN-CP Telecommunications in 1971. The Telenet system concept is a number of subscriber networks controlled by central computers. The message-switching computer centres will handle many customers but each customer's network is completely private. In its initial phase, Telenet offerings will be confined to message switching and related features such as speed and code conversions, message storage and retrieval, high-speed data handling, interface with customer-owned computers and message refile. A single message may be transmitted for delivery to as many as 32 destination stations by one group-routing indicator at one time. Two levels of priority are recognized by the computers. Messages marked "quick" are handled immediately by the system. Message-switching computers are located at CNT offices in Toronto and CPT offices in Montreal and all Canadian subscribers' requirements are routed by one of these centres. Future plans call for switching-computer centres at Vancouver, Edmonton, Winnipeg and Halifax. Various options and capabilities of Telenet will enable CN-CP to custom design a system to meet specific needs of individual subscribers.

**Domestic Commercial Satellite Communications Facilities.**—Increasing activity in the Canadian Arctic and sub-Arctic where communities are being expanded and new ones formed, as well as forecasts of the telecommunications needs of all of Canada, prompted the telecommunications industry and the Federal Government to consider a domestic satellite system. In 1966, a proposal from Niagara Television Limited and the Power Corporation of Canada Limited was submitted to the (then) Board of Broadcast Governors for a satellite system to distribute television programs for a third national television network. In March 1967, the Trans-Canada Telephone System and CN-CP

Telecommunications proposed to the Government a domestic satellite telecommunications system to carry television, telephone calls, data and other telecommunications services. In that same year, RCA Victor Company Limited issued a proposal giving definite design criteria for a communications satellite within the capabilities of Canadian industry. In 1968, the Northern Electric Company announced an agreement with Canadair Limited and Hughes Aircraft of California to form a group interested in designing and building equipment for satellite communications. For some time the subject was also under study by the Ministry of Transport and the result of this study was presented to the Government in 1967. By July of 1967, an intense interest had developed in the potential of a domestic satellite system and the Prime Minister announced the creation of a task force, under the direction of the Science Secretariat, to advise on satellite policy in general and, in particular, on the use of satellite technology for domestic communications.

Following the release on Mar. 28, 1968, of a White Paper based to a large extent on the recommendations of the Task Force on Satellite Policy, the Government of Canada established Telesat Canada by Act of Parliament (RSC 1970, c. T-4), which came into force by proclamation on Sept. 1, 1969, to establish Canadian Domestic Satellite Telecommunication Systems providing telecommunications services on a commercial basis. Telesat Canada is not a Crown corporation but is designed to be a commercial company owned jointly by the Government of Canada, the telecommunications common carriers, and the general public, according to the provisions of the Act. The annual report of the company is tabled in the House of Commons by the Minister of Communications.

Plans are proceeding for a target launch date by early 1973 of the first satellite, to be named *Anik*, an Eskimo word meaning "brother". The initial system, consisting of some 35 ground stations and a satellite, will be designed to provide television and radio distribution in both English and French to many parts of Canada not now served by terrestrial facilities; to provide telephone communications in Northern Canada; and to supplement existing microwave systems serving Southern Canada. The satellite will be capable of simultaneous transmission of all these services from stationary orbital positions to virtually all of Canada in association with the ground stations. Present plans are to lease services to the Trans-Canada Telephone System, CN-CP Telecommunications and the Canadian Broadcasting Corporation.

When present plans materialize, Canada will be among the first nations in the world to operate a domestic commercial satellite communication system. The whole of Canada is visible in space from that part of the equatorial orbital plane lying between 96° and 116° West Longitude. This forms a 20°-arc and contains the satellite positions most desirable for Canadian domestic service. The satellite or satellites maintain a stationary orbit at an altitude of 22,300 miles which means that they will rotate with the earth every 24 hours and therefore at any particular time of the day be over the same spot on earth.

Basically, satellite communication is just one long microwave link. The clarity and strength of transmission provided by a satellite will be comparable to that of existing microwave systems; only with respect to time required for transmission from an originating earth station to a satellite and back to another receiving earth station will there be a noticeable difference. Because of the 22,300-mile altitude of the satellite, the two-way transit time will be about 600 milliseconds or six tenths of a second. This delay will be of no concern for one-way transmission services such as television, but it must be taken into account in the case of two-way voice circuits. To minimize the time effects, there must be an avoidance of tandem connections on space facilities and, wherever possible, the operation of voice circuits with one direction via satellite and the other via ground facilities.

The first-generation satellites will end their life cycle about five years after they are put into operation and undoubtedly additional satellite capacity will be required by then. The scope, capacity and design of the second-generation Canadian satellite will depend on technical developments and traffic requirements during the intervening years. Canada's microwave, land-line and troposcatter systems will continue to be the backbone of tele-

A tracked vehicle on access road to a microwave site in the Yukon Territory. →

Route of the recently constructed combination microwave - scatterwave telecommunication system linking the Yukon and the Northwest Territories. ↓

communications services for many years to come but satellite communications, properly integrated with land facilities, will make it possible to reach all areas to which service has not yet been economically feasible.

**International Satellite Communications.**—Since the *Telstar* satellite was launched in 1962, Canada has made use of international satellites to connect to broadcast systems in other continents. In 1964, Canada became one of the 20 charter members of *Intelsat*, the International Telecommunication Satellite Consortium, which now numbers 68 countries. Thus, Canada is a joint owner of *Intelsat* satellites and participates in the global satellite system established by *Intelsat*.

Acting through the Crown-owned Canadian Overseas Telecommunication Corporation, Canada is currently using the *Intelsat* satellites for intercontinental telephone, data and television relays to and from the domestic communications systems of CN-CP Telecommunications and the Trans-Canada Telephone System.

**Public and Private Commercial Microwave Facilities.**—Canada, because of its population distribution and the vast areas served by microwave links, ranks second highest among the world's users of microwave communications systems on a per capita/per mile

basis. Increasing demand for television outlets has necessitated the extension of microwave routes to provide interconnections for the CBC English and French and private networks and these routes have been upgraded to permit the transmission of colour television. With the use of more automated equipment by industry and various services, associated data and control information must be transmitted at rapid speeds over microwave radio-relay to widespread areas throughout the country.

*Railways.*—CNT and CPT have placed in operation a microwave system extending from Moncton, N.B., to Nanaimo, B.C., which is used for television, telephone and data relay purposes. On its own, CNT has microwave facilities linking Newfoundland to the Maritime Provinces at Sydney, N.S., and across the Strait of Belle Isle to Labrador and to Quebec at Blanc Sablon. In addition, CNT has installed a microwave system from Grande Prairie, Alta., through the Yukon Territory to Alaska which carries telephone and data traffic and serves both civil and military organizations in the area. In co-operation with Alberta Government Telephones, a combination microwave and tropospheric scatterwave system connects Alberta through the Northwest Territories to Lady Franklin Point on Victoria Island. A \$3,000,000 construction program was completed in 1971 by CNT which provides a combination microwave-scatterwave system linking the Yukon Territory with the Northwest Territories. Microwave is used from Whitehorse to Keno and a tropospheric scatterwave system bridges the Richardson Mountains from Keno to Arctic Red River. From there microwave is used north to Tuktoyaktuk. A scatterwave system hurls transmission up to the troposphere where it is bounced back to the next station some 600 miles away. Microwave systems are also being built by CNT between Fort Providence and Fort Simpson and between Inuvik and the communities of Old Crow and Fort Macpherson.

The Quebec North Shore Labrador Railway has developed a microwave system extending into northern Quebec to provide communication for mining operations and to serve some civil communication purposes. Ontario Northland Railways operates microwave installation connecting northern Ontario and James Bay, also for purposes of military and civil communication. The British Columbia Railway makes extensive use of 6,000 Mc/s microwave facilities linking Vancouver with Prince George and Dawson Creek, B.C.

*Telephones.*—The Trans-Canada Telephone System (TCTS), comprised of eight provincial and private telephone companies, collectively provides two transcontinental microwave systems for the purpose of carrying telephone, television, data and other types of communication services. Major expansion has taken place in each province during the past few years, greatly increasing the number of areas served and system capacity of all types of communications requirements. Tropospheric scatterwave systems are used to provide beyond-line-of-sight transmissions, especially to the Far North for civil and military applications. The British Columbia Telephone Company has a major trunk system from Prince Rupert to Prince George, which is linked through Prince George with the transcontinental system in the southern part of the province. A microwave system links Mill Village communication satellite earth station near Liverpool, N.S., within the trunk route system of the Maritime Telephone and Telephone Company.

The TCTS announced plans in 1971 to build three digital networks—two of them on existing coast-to-coast microwave facilities. The three-stage program will be completed by 1976 at a cost of \$100,000,000. Digital networks are primarily for data transmissions (see p. 945).

*Television.*—The two main television interests in Canada—the Canadian Broadcasting Corporation and CTV Television Network Limited—lease common-carrier microwave facilities for the relay of television programs from coast to coast. In addition, studio transmitter links are used by various television stations where the television transmitted is located some distance from the studio and interconnection is required. In sparsely populated areas, off-the-air pick-up signals from primary television stations are sometimes relayed by microwave to rebroadcasting sites. Microwave facilities are also used in con-

nection with portable and mobile television pick-up where program material is intended for the main studio. Both network facilities and local studio transmitter links have been upgraded to enable the transmission of colour television.

*Industrial.*—Although many firms use commercial communications facilities on a lease basis, some organizations have installed private microwave systems to provide voice, teletype and control data for various purposes. The British Columbia Hydro and Power Authority, the Calgary Power Corporation, The Hydro-Electric Power Commission of Ontario, the Quebec Hydro-Electric Commission and Manitoba Hydro use a considerable number of microwave relay systems for important control and communications purposes. For example, Hydro-Quebec has greatly expanded its hydro power generating capacity and new microwave routes have been added to permit a central control of the various generating stations. The British Columbia Hydro and Power Authority has installed facilities to link the Vancouver area with Peace River, Mica Creek and the Bonneville Power Administration in the State of Washington as well as system control in the Vancouver area. Ontario Hydro has constructed an extensive microwave system to provide important control, monitoring and communications with all their facilities in southwestern Ontario.

*Instructional.*—The Department of Communications has opened the 2,600 MHz. microwave band for use by the various educational authorities in Canada for instructional TV systems. Some systems have now been licensed and others are being planned. The largest system is at Calgary, which provides television communications to 24 schools. The Province of Ontario established the Ontario Educational Communications Authority and is in its second season of broadcasting on UHF channel 19 in Toronto; other UHF educational television channels are to be established across the province.

**Miscellaneous Radio Communication Services.**—In addition to radio communication services provided by the Federal Government, extensive radio communication systems have been established in the provinces and territories, mainly for police, highway and forestry protection purposes. Municipal government departments continue to increase their use of radio to facilitate operations, particularly with their vehicles—police, fire, engineering, etc. Such services as taxi, heavy construction, ready-mix concrete, oil pipeline construction and operation, veterinarian and rural medical also make extensive use of radio for communication purposes.

Public utilities, power companies, provincial power commissions, oil exploration and mineral development organizations have expanded considerably their use of radio in both mobile and point-to-point radio fields.

The telecommunications companies provide an extension of telephone service, by radio, to suitably equipped vehicles. This service is available in all major cities in Canada and along many of the nation's arterial highways. Restricted common-carrier mobile radio service (which does not permit interconnection with the over-all telephone system but only with specific dispatchers) is available in most of the larger cities, as well as in a number of the smaller urban centres. It is provided by telephone companies as well as by other organizations. Low-power radio stations may be licensed to permit short-distance personal and private business radio-telephone communications.

## Subsection 2.—Telephone and Telegraph Statistics

**Telephone Statistics.**—In 1970 there were 1,716 telephone systems operating in Canada compared with 1,888 in 1969; of these systems, 1,376 reported in 1970 and 1,618 in 1969. Co-operative systems in rural districts decreased in number from 1,486 to 1,256 in the same comparison and incorporated companies from 92 to 84. The largest of the incorporated companies, Bell Canada, which operates throughout the greater part of Ontario and Quebec and in Newfoundland and the Northwest Territories, served 62 p.c. of all the

telephones in Canada in both years and the British Columbia Telephone Company, also shareholder-owned, served 10 p.c. of the total in 1970. The number of telephones in use continues to increase at the rate of about 5 p.c. annually.

### 1.—Pole-Line and Wire Mileage and Number of Telephones in Use, 1961-70

Year	Systems Reporting	Route Mileage	Length of Wire	Telephones in Use			
				Business	Residential	Total	Per 100 Population
	No.	miles	miles	No.	No.	No.	No.
1961.....	2,509	306,167	26,986,478	1,729,599	4,284,416	6,014,015	32.6

The major telephone systems record completed calls on representative days throughout the year and on this basis estimate the number of local conversations which, added to the actual count of long-distance calls, gives their total volume of business. Estimates are included for the smaller systems.

### 3.—Local and Long-Distance Calls and Average Calls per Capita and per Telephone, 1961-70

Year	Local Calls	Long-Distance Calls	Total Calls	Total Calls per Capita	Average Calls per Telephone		
					Local	Long-Distance	Total
	'000	'000	'000	No.	No.	No.	No.
1961.....	10,242,657	226,258	10,468,915	568	1,703	37.6	1,741

**Telegraph Statistics.**—There were nine telegraph and cable companies operating in Canada during 1970, but, as already stated, telegraph service is provided mainly by the telecommunications departments of the two major railway companies (see also p. 946). The number of telegrams sent continues to decline year by year, giving way to other types of message transmission, but the number of cablegrams sent has been rising. The business of telegraph and cable companies appears to be changing from one of handling messages directly to one of leasing equipment for the transmission of messages by others. Revenues from the latter source have been rising over the past several years and have been the main factor in the steady advance in total operating revenues. Total cost of property and equipment for all telegraph and cable companies was \$570,555,592 in 1970, increasing from \$545,694,618 in 1969.

## 6.—Summary Statistics of Canadian Telegraphs, 1961-70

Year	Operating Revenues	Operating Expenses	Net Operating Revenue	Pole-Line Mileage	Wire Mileage	Employees <sup>1</sup>	Telegrams	Cablegrams <sup>2</sup>	Money Transfers

<sup>1</sup> Excludes commission operators.<sup>2</sup> Includes wireless messages and transatlantic Telex messages.

## Subsection 3.—Federal Control over Telecommunications and Federal Civil Telecommunications Services\*

## Federal Control over Telecommunications

The Department of Communications was established on Apr. 1, 1969, under the authority of the Government Organization Act of that year, and operates under authority of RSC 1970, c. C-24. The duties, powers and functions of the Minister of Communications extend to and include all matters relating to telecommunications over which the Parliament

\* Prepared by the National Telecommunications Branch, Department of Communications, Ottawa.

of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada; and the development and utilization generally of communication undertakings, facilities, systems and services for Canada. He is responsible for the administration of the Telegraphs Act (RSC 1970, c. T-3), the Radio Act (RSC 1970, c. R-1), and the Canadian Overseas Telecommunication Corporation Act (RSC 1970, c. C-11).

Telephone and telegraph companies incorporated under the Federal Parliament are subject to the jurisdiction of the Canadian Transport Commission in the matter of rates and practices under the provisions of the Railway Act. Previously the CTC regulated rates only in those cases in which a charge was made to the general public; recent amendments to the Railway Act extend the jurisdiction of this body to cover rates charged for private wire services as well. International telegraph and telephone communications are handled subject to the International Telecommunication Convention and its Regulations, or under regional agreements, or both. Overseas cables landed in Canada are subject to the External Submarine Cables Regulations under the Telegraphs Act.

Radiocommunications in Canada, except for those matters covered by the Broadcasting Act, are regulated under the Radio Act and Regulations, and the Canada Shipping Act and Ship Station Radio Regulations. Amendments to the Radio Act in the past year provide for the licensing of Canadian earth and space stations engaged in space communications services. Radiocommunications in Canada are administered in accordance with the International Telecommunication Convention and Radio Regulations annexed thereto; the International Civil Aviation Convention; and the International Convention for the Safety of Life at Sea. A number of Canadian-United States conventions and agreements are also in effect, such as: the Convention for the Promotion of Safety on the Great Lakes by means of Radio; the Convention relating to the operation by citizens of either country of certain radio equipment or stations in the other country; the Agreement relating to the Co-ordination and Use of Radio Frequency above Thirty Megacycles per Second; the Television and FM Agreements; and the Agreement relating to the operation in either country of radiotelephone stations licensed in the Citizens Radio Service of the United States and the General Radio Service of Canada. In addition, Canada is a party to the North American Regional Broadcasting Agreement.

Under the Broadcasting Act of 1968, the Canadian Radio-Television Commission issues licences for broadcasting undertakings. However, the licences are not issued unless the Minister of Communications certifies to the Commission that the applicant has satisfied the requirements of the Radio Act and regulations thereunder, and has been or will be issued a Technical Construction and Operating Certificate under that Act. Broadcasting undertakings include radio (AM and FM) and television broadcasting stations, community antenna television (CATV) systems, and network operations. The technical rules and procedures for the allocation of frequency channels and installation and technical operation of broadcasting station facilities are set forth in the Department's *Broadcast Procedures and Radio Standards Specifications*. These documents form the basis for determining the acceptability of applications for Technical Construction and Operating Certificates and for the control of the technical operation of broadcasting undertakings. The availability of the technical facilities for broadcasting is subject to the terms of the North American Regional Broadcasting Agreement, the Canadian-U.S.A. Television Agreement and the Canada-U.S.A. FM Agreements.

Telesat Canada, a Corporation created by an Act of Parliament, June 27, 1969 (RSC 1970, c. T-4), is responsible for Canada's proposed domestic communications satellite. It has a unique form of financing—the Government, designated common carriers, and the general public will each be offered about one third of its shares. The Corporation reports to Parliament through the Minister of Communications. (See also p. 950.)

**Licensing and Regulation of Radio and TV Stations.**—Licensing is the Federal Government's method of maintaining control over radiocommunications in Canada. Under the Radio Act, radio stations (other than those used in broadcasting undertakings) employing any form of Hertzian wave transmission, including television and radar, are re-

quired to be licensed by the Department of Communications, unless exempted by regulation. There are six classes of radio station licence: Coast, Land, Mobile, Ship, Earth and Space. Various categories of service may be authorized under each of these classes; for example, Public Commercial Service, Private Commercial Service, Amateur Experimental, etc. The number of licences in force for radio stations in Canada in the year ended Mar. 31, 1971 was 256,327 compared with 245,789 in 1969-70. These figures include stations operated by federal, provincial and municipal government departments and agencies, stations on ships and aircraft registered in Canada and stations in land vehicles operated for both public and private purposes, but they do not include stations in the broadcasting service. Following are comparative figures for the licensing periods 1969-70 and 1970-71:—

<i>Item</i>	<i>1969-70</i>	<i>1970-71</i>
New applications received.....	31,509	29,125
Authorization granted.....	27,787	23,537
Licence amendments.....	25,166	22,272
Licence cancellations.....	16,873	18,198
Total licences in force.....	245,789	256,327
Net increase in licences in force over preceding year.....	16,004	10,538

Radio Standards in general are drawn up in consultation with the electronic industry and users of radio, taking into account such technical factors as those which affect frequency spectrum utilization, reliability of apparatus, and compatibility under conditions of service. To facilitate the development of standard specifications, and for testing necessary to determine whether apparatus complies, the Department of Communications maintains an engineering laboratory.

Licensing involves the assigning of specific frequencies to each station. Bands of frequencies are allocated for various types of services, often on a shared non-interference basis. Frequency selection, compatibility evaluation, domestic registration (computerized data base with a file size of more than 51,000,000 characters), and notification with the International Frequency Registration Board (IFRB) of the International Telecommunications Union at Geneva are carried out to ensure efficient use of the spectrum. Assignments are made in keeping with international and domestic statutes and regulations, regional agreements and domestic policies. The IFRB is notified of frequency assignments for technical examination and for inclusion, with appropriate "in-service" dates, in the Master International Frequency Register so that Canadian assignments will receive international recognition and be given protection from interference by foreign stations. "In service" dates are necessary when determining prior right to the use of particular frequencies.

The enforcement activities of the Telecommunications Regulation Branch, Department of Communications, include the technical inspection of all radio stations including the monitoring and measurement of their radiated signals to ensure compliance with the regulations and conditions of licensing; the location and suppression of radio interference; the technical examination of candidates for the various classes of certificates of proficiency in radio which must be held by the operators of radio stations; and the direction of prosecutions in the courts. These functions are carried out through personnel located at 34 radio regulations inspection offices, 10 fixed monitoring stations, seven mobile monitoring vehicles, and six regional spectrum observation centres across Canada. Through decentralization, the six regional offices share with headquarters in the direction of day-to-day activities of the Telecommunications Regulation Branch, and the development of suitable programs and facilities for the recruitment and training of necessary technical personnel for the Department.

### Federal Civil Telecommunications Services

The Department of Communications is made up of the Communications Research Centre formed from the Department of Defence Research Telecommunications Establishment, the Telecommunications Management Bureau transferred from the Ministry of Transport, and the Policy, Plans and Programs Branch. The work of the Research Centre

ranges from fundamental studies on materials and circuits to the design of advanced high-reliability avionics and aerospace electronic systems. The Telecommunications Management Bureau is responsible for: (1) development of policy and plans with respect to national and international telecommunications by satellites, cables and other media including relations with the Canadian Overseas Telecommunication Corporation and participation in the work of the International Telecommunications Union and its subsidiary organs; (2) establishment and review of the telecommunications requirements of the Federal Government departments and agencies throughout Canada, and co-ordination of the planning and provision of faculties to meet these needs; (3) planning of emergency measures and administration of the Emergency National Telecommunication Organization (ENTO); (4) development and maintenance within the Bureau of a centre of competence in the latest telecommunications technology; and (5) administration of the Radio Act and Regulations including allocation and assignment of radio frequencies, radio provisions of the Canada Shipping Act, Ship Station Radio Regulations, the Telegraphs Act and the Regulations thereunder covering the licensing of transoceanic cables. The Policy, Plans and Programs Branch is responsible for the development of long-range plans and policies and the co-ordination of investigations and research programs that will improve knowledge about the Canadian communications environment. Each of these three major sectors of the Department reports to an Assistant Deputy Minister—ADM (Research), ADM (Operations) and ADM (Planning), respectively.

**Radio Aids to Marine and Aeronautical Navigation.**—Federal services in aid of marine and aeronautical navigation are outlined in the following paragraphs; details may be obtained on request from the Ministry of Transport, Ottawa. Six regional offices, located at Vancouver, B.C., Edmonton, Alta., Winnipeg, Man., Toronto, Ont., Montreal, Que., and Moncton, N.B., carry out the construction and operation of the facilities.

**Marine Navigation.**—Radio aids to marine navigation are provided for radio-equipped Canadian vessels and foreign ships using Canadian waters. This safety and communications service for shipping covers the East and West Coasts, the Great Lakes, the St. Lawrence River and Gulf, Hudson Bay and Hudson Strait and includes regularly broadcast weather reports, storm warnings and notices of danger to navigation. Ships at sea may obtain medical advice from any coast station. The stations carry out communications by radio-telegraph and/or radiotelephone and most of them provide connections to land telephone lines. Halifax (VCS) and Vancouver (VAI) stations provide long-range radiotelegraph and radiotelephone services to ships. Coast stations on Hudson Bay and Hudson Strait, in addition to their regular services, provide commercial communications for posts of the Hudson's Bay Company and various prospecting and development organizations, make weather observations, handle administrative traffic and assist aircraft with information, landing conditions, etc.

Automatic radiobeacon stations are maintained on the East and West Coasts, the St. Lawrence River and Gulf, the Great Lakes and Hudson Bay and Strait, giving navigational aid to mariners by transmitting signals on which bearings may be taken. These stations are arranged, where possible, in groups up to a maximum of six stations transmitting in sequence on a common frequency, the sequence being repeated continually regardless of weather conditions.

**Loran** is a long-range radio aid to marine and air navigation providing accurate fixes at distances up to 750 miles by day and 1,500 miles by night. Two Loran stations operate in Nova Scotia, three in Newfoundland and two on the West Coast. These stations, in conjunction with Loran stations of the United States Coast Guard, give service to ships and aircraft plying the North Atlantic and Pacific Oceans. **Decca** is a short-range radio aid to navigation providing accurate fixes at distances up to 250 miles. Four chains of Decca stations are in operation—the Newfoundland chain, the Nova Scotia chain, the Anticosti chain and the Cabot Strait chain—giving service to ships off Newfoundland and Nova Scotia and in the St. Lawrence River and Gulf.

It has become general practice to equip merchant ships with radar and important buoys are fitted with radar reflectors to increase their radar visibility. A shore-based radar installation is in operation on the Lion's Gate Bridge across the entrance of Vancouver Harbour. Four radar responder beacons (RACONS) are in year-round operation on the East Coast; three in the Western Arctic and one in the Great Lakes are in operation during the navigation season. Low power transceivers are provided for use in emergencies at lighthouses, particularly at locations that would otherwise be completely cut off from assistance in case of illness.

*Aeronautical Navigation.*—Radio aids to air navigation are provided by the Ministry of Transport from coast to coast and from the United States border to the Arctic regions for use by Canadian aircraft and foreign air carriers flying over Canadian territory.

Low frequency radio aids operating on the frequency band 200-415 KHz are generally located within a distance of 50 to 100 nautical miles of each other to form the low frequency airways system. A few are located "off airways" in remote regions and a number of low power radiobeacons serve major airports as terminal and landing aids. The Ministry of Transport operates 275 en route, low frequency aids (20 of which are the older type radio range class) and 61 low power terminal radiobeacons. These facilities are used primarily in association with airborne direction finding equipment. Voice channels on a number of low frequency aids are also used for aircraft communications and weather broadcast purposes.

Operating on the higher frequency bands VHF (very high frequency) and UHF (ultra high frequency), the Ministry of Transport operates 64 VHF Omni-directional Ranges (VOR), 60 Instrument Landing Systems (ILS) and 31 Tactical Air Navigation Systems (TACAN).

The VOR stations form the VHF airways system which closely parallels the older low frequency airways system. Use of the VOR permits a pilot to select any desired course. Additional VOR stations are being constructed on a continuing basis. TACAN stations are collocated with the VOR at 30 locations. The TACAN provides the pilot with a readout of the distance of the aircraft from the VOR station. The complete station is called a VORTAC.

Instrument Landing Systems (ILS) provide radio signals which permit aircraft landings during periods of low visibility. Radio transmitters provide lateral and slope guidance to the approach end of the runway and also provide an indication of the distance to the runway threshold. For air traffic control purposes, there are three main classes of radar in operation at Canadian airports consisting of: 15 airport and airways surveillance radars (AASR) with a range of 150 nautical miles; eight airport surveillance radars (ASR) with a range of 50 nautical miles; and nine precision approach radars (PAR), which are short-range radars used for landing at major airports.

Radiotelephone communications are provided by 116 ground stations called Aeradio Stations. From these stations, a pilot may obtain weather data, air traffic control instructions and other information concerning flight safety. These stations operate for the most part on the very high frequency (VHF) band but in the north and on international routes high frequency (HF) is utilized to provide the necessary long-range coverage. Thirteen of the 116 stations engage in international communications services for Canadian and foreign air carriers. All these ground stations are connected to a fixed teletype network with over 48,000 circuit miles provided to meet aeronautical communications needs.

#### **Subsection 4.—Overseas Telecommunications Services**

The Canadian Overseas Telecommunication Corporation (COTC) was established in 1950 to maintain and operate external telecommunication services for the conduct of public communications by cable, radiotelegraph and radiotelephone and any other means of telecommunication between Canada and overseas points; to make use of all developments in

cable and radio transmission and reception for external telecommunication services; and to conduct investigation and research with the object of improving and co-ordinating such telecommunication services with the telecommunication services of other nations.

The services currently being provided are as follows: direct telegraph, telephone and telex communications between Canada and Argentina, Australia, Austria, Barbados, Belgium, Bermuda, Brazil, Britain, Chile, Cyprus, Denmark, Finland, France, Germany, Greece, Hong Kong, the Irish Republic, Iceland, Israel, Italy, Jamaica, Japan, the Netherlands, New Zealand, Norway, Peru, the Soviet Union, Sweden, Switzerland and Trinidad and Tobago; direct telephone and telegraph services with the Islands of St. Pierre and Miquelon; direct telephone with Antigua, the Philippines, South Africa, Spain and Venezuela; and direct telex with Portugal and the Philippines. Datel 600 service is in operation between Canada and Australia, Belgium, Britain, France, Germany, Hong Kong, Italy, Japan, Sweden and Switzerland. International telex service is provided with 164 countries.

The first transatlantic telephone cable, a joint project with the British Post Office, the American Telephone and Telegraph Company, Eastern Telephone and Telegraph Company and the Corporation, was brought into service in 1956. Since 1961, the following cables have been brought into service: the Canada-Greenland-Iceland 24-circuit telephone cable (ICECAN)—a two-party enterprise of the Great Northern Telegraph Company of Denmark and COTC; the Canada-Britain 80-circuit telephone cable (CANTAT); the Commonwealth Trans-Pacific 80-circuit telephone cable—a four-party enterprise of Canada, Britain, New Zealand and Australia, connecting Vancouver and New Zealand and Australia via Hawaii and Fiji (COMPAC); the South East Asia Commonwealth 80-circuit cable—a six-party enterprise of Canada, Britain, New Zealand, Australia, Malaysia and Singapore, connecting Australia, Hong Kong, Singapore and Kuala Lumpur via New Guinea and Guam (SEACOM); the Canada-Bermuda 640-circuit cable—a two-party enterprise of Canada and Britain (CANBER); and a number of circuits for Canadian purposes acquired in telephone cable systems connecting Bermuda, Jamaica, Puerto Rico and the United States.

The Corporation also operates direct circuits via the Atlantic satellites with Antigua, Argentina, Austria, Barbados, Belgium, Brazil, Britain, Chile, Denmark, France, Germany, Greece, Italy, the Irish Republic, Israel, Jamaica, the Netherlands, Peru, Spain, Switzerland, Trinidad and Tobago, and Venezuela. The earth station constructed for the Ministry of Communications for research and experimentation with respect to satellites at Mill Village, N.S., and the Corporation's own earth station at the same location, operate with the larger capacity satellites of the International Telecommunications Satellite Organization (INTELSAT) III and IV series. The Corporation at present operates direct circuits via the Pacific Satellite with Australia, Hong Kong, Japan, New Zealand, and the Philippines through the American-owned earth station at Jamesburg, California, pending the completion of its own earth station under construction on Vancouver Island, scheduled for the latter part of 1972. Apart from normal use of its system for television, public telephone, switched data, telex and telegraph message traffic, capacity is available for private leased circuits.

Canada, represented by Canadian Overseas Telecommunication Corporation, is a signatory to the Operating Agreement of the INTELSAT set up by the participating nations for the development and operation of a global communications satellite system. The Corporation also represents Canada on the Commonwealth Telecommunications Council.

The Corporation, under a long-term agreement, has under charter from the Ministry of Transport the CCGS *John Cabot*, a combined ice-breaker/cable-repair ship used mainly for repairing the cables in the western North Atlantic Ocean. The Corporation also operates a cable depot at St. John's, Nfld.

Increased use of all types of overseas telecommunication services resulted in the COTC reporting a net profit of \$5,355,061 for the year ended Mar. 31, 1971. Income for the year amounted to \$33,582,193.

## Section 2.—Radio and Television Broadcasting\*

Broadcasting began in Canada with the transmission of an experimental program by a Montreal radio station in 1918. Since that time radio and television have come to play a prominent part in the daily life of almost every Canadian. To have become such a vital national force, broadcasting had to learn the needs of the people and how to serve them. Two official languages, the foundation of two distinct cultures, had to be served independently and dozens of other cultural groups with widely divergent program interests also had to be served. Hundreds of radio transmitters, television stations, and repeaters are required to reach a population distributed over more than 3,500,000 sq. miles comprising seven time zones and a great variety of topographical and climatic regions. Not only do Canadians have local service that is a reflection of life in their own districts but, by means of thousands of miles of land lines for radio networks and microwave circuits for television, nearly every Canadian may listen or watch as an event of national or international interest takes place.

The broadcasting system in Canada has both public and private components. The earliest legislation with respect to Canadian broadcasting was passed in May 1932, creating the Canadian Radio Broadcasting Commission, but the basic principles for radio and television broadcasting have been revised over the years. The Broadcasting Act of 1968 (RSC 1970, c. B-11) entrusted the Canadian Radio-Television Commission under Part II of the Act with the direction of the Canadian broadcasting system. The CRTC is composed of five full-time Commissioners and ten part-time Commissioners, representative of the various regions of Canada. The Commission regulates and supervises all aspects of the broadcasting system, except for technical matters relating to the planning and construction of broadcasting facilities, which are the responsibility of the Department of Communications.

The Canadian Broadcasting Corporation, a publicly owned corporation established by Act of Parliament (now Part III of the Broadcasting Act), provides the national broadcasting service in Canada. Its radio and television facilities extend from the Atlantic Ocean to

\* Prepared by the Canadian Radio-Television Commission, Ottawa.

the Pacific, and north to the Arctic Circle. The CBC, created in 1936 to replace an earlier public broadcasting agency that had operated since 1932, is financed mainly by public funds voted annually by Parliament, with supplementary revenue obtained from commercial advertising. The head office is in Ottawa and the main production centres are Toronto for the English networks and Montreal for the French networks. Regional centres operate across the country.

An applicant for a licence to establish and operate an AM, FM or TV broadcasting station, a community antenna television system (CATV) or a network, files application forms with the Secretary of the CRTC. If found acceptable by the Commission, a public notice of the application is issued in the *Canada Gazette* and in one or more newspapers of general circulation within the area served or to be served by such station or system prior to the holding of a public hearing. The same procedure applies to an application for renewal or amendment of an existing licence.

**Radio.**—Despite the impact of television, radio remains an important means of communication for Canada's population. The CBC networks provide a wide variety of programming on a national basis and private local stations attract a large percentage of the listening audience.

About 97 p.c. of the households in Canada are equipped with radio. In about half of them there is more than one set, and often there is a radio in the car and one or more portable transistor sets. It is estimated that there is one radio for every two persons. To serve this audience, the CBC operates an English-language network and a French-language network and there are a considerable number of privately owned radio stations in operation, some affiliated with the CBC networks and some serving an entirely local function. Of the 331 AM stations in operation in 1971, 36 were owned by the CBC and 295 were privately owned. The English network consisted of 28 CBC-owned and -operated stations and 61 private affiliates; the French network was made up of eight CBC stations and 37 private affiliates. There is also a second French-language network consisting of five private radio stations. The 192 unaffiliated private stations performed a basically local community service. Of the 86 FM stations, 10 were operated by the CBC and 76 were privately operated. The private stations are financed entirely from advertising revenue.

In addition to a coast-to-coast English network and a French network that reaches a large proportion of the country's French-language population in eight of the 10 provinces, the CBC provides regional and local services. Its networks extend over more than 28,000 miles. It has its own news service and offers a wide variety of programs in information, public affairs and entertainment. It also provides three special services—the international service, the northern service, and the Armed Forces service.

**Television.**—Television programming began in Canada in 1952 and colour broadcasting in 1966. Of the 5,798,100 households in the country, 5,250,000 are equipped with one or more television sets. Two of the four Canadian television networks in operation are operated by the CBC, one in English and one in French. The 5,000-mile microwave network that links St. John's in Newfoundland to Vancouver Island and the Pacific Northwest is one of the longest in the world. The second English network, CTV, is composed of 77 privately owned stations, 12 of which originate programming; it reaches over half of the homes that have television in Canada and continues to increase its coverage. An application for the formation of a second French television network was approved by the CRTC in March 1971; in 1971 it consisted of three private stations in the Province of Quebec.

As of September 1971, Canada had 92 originating stations, including 17 Frontier Coverage Package stations—undertakings that broadcast CBC network programs on a delay basis—and 361 rebroadcasting stations. The CBC owned and operated 35 stations and 103 rebroadcasting transmitters and provided a substantial proportion of its national programming service through 40 privately owned stations which, with their 187 rebroadcasting stations, are affiliated with it. Eight privately owned stations have no network affiliation.

*Trans-Canada Telephone System companies that supply telecommunications facilities to Canadian telecasters were all hooked together for the first time in October 1971 to broadcast to a select audience of technicians the first of a series of operational instructional video tapes aimed at standardizing the technical details of running Television Operating Centres.*

From the start, the development of Canadian television was complicated by geographical and language factors. About half of the people of Canada live near the southern border and have access to programs broadcast by one or all of the major United States networks. This fact and the need to maintain a Canadian identity and to articulate Canadian interests contributed to the rapid development of Canadian television services. Toronto and Montreal now rank among the world's principal television production centres in the English and French languages; Vancouver, Edmonton, Winnipeg, Ottawa, Quebec City, Halifax and St. John's are the regional production centres. Of the 18 CBC stations that originate programming, 13 broadcast in English and five in French; of the 57 private stations, 32 English-language and eight French-language stations are affiliated with the CBC. There are 12 private English-language stations affiliated with the CTV network. Three French-language stations are affiliated with the second French television network, Télé-Métropole Corporation. Two English-language stations, independent of any network affiliation, are also in operation.

**Cable Television.**—Basically, cable television is an antenna system linked to the individual subscriber's set by cable through a series of amplifiers, making it possible to bring the subscriber signals he could not otherwise obtain. Cable systems are capable of carrying AM and FM radio as well as VHF and UHF television signals. For this service, the subscriber customarily pays an installation fee and a monthly rental of about \$5 a month. Systems range in size from 38 with fewer than 100 subscribers to five with more than 100,000. As of September 1971, there were 353 cable television systems operating in Canada, serving about 26 p.c. of all urban households in the country.

Cable television is recognized as an integral part of the Canadian broadcasting system and policies and regulations that concern it must take into account the effects on other

aspects of the national system. Cable television systems (CATV) are operated by private companies, each of which must be approved technically by the Department of Communications and licensed by the CRTC.

The CRTC in July 1971 announced its policy on cable television, emphasizing its mandate to provide the best possible service and widest choice from every source for the Canadian viewer. It is recognized that cable television provides an improved picture quality and extends the service area of broadcasting transmitting undertakings. It has given viewers a greater variety of programs and has made possible a greater information flow. The policy established the composition of the basic services that cable television must provide, including CBC and other Canadian local and regional stations, a community channel and, where requested by provincial authorities, access for educational programming. The CRTC will authorize cable television systems to carry distant stations using microwave or other electronic communication systems which technically extend the receiving system. Cable systems which fulfil the basic Canadian services to the community will be permitted to provide other channels, including up to three channels from stations not licensed in Canada.

The capacity of cable television systems to import distant signals can fragment local audiences and can have an adverse effect on local broadcasting outlets. Cable systems take programs off-the-air from locally licensed television stations and distribute them in a multitude of other areas without contributing to the production cost of these programs. The CRTC has concluded that cable television systems should pay for the Canadian programs and services received over the air by buying additional Canadian programs from local and regional licensees as well as network sources for play or replay on their systems, thus providing additional exposure for Canadian programs. A policy of program deletion and replacement, where identical programs are scheduled by stations already serving the community, will enable stations already licensed to serve an area to regain their portion of the local audience without reducing or restricting viewer choice. The CRTC also encourages a similar policy for commercial messages. Although cable licensees will not be permitted to sell advertising, they may remove the commercial content of signals not licensed to serve Canada and insert replacement commercial messages sold by Canadian television stations.

### **Operations of the Canadian Broadcasting Corporation, 1970-71\***

**Programming.**—The CBC continued to increase its Canadian program content during 1970-71. Both English and French television networks achieved prime-time Canadian content levels of about 70 p.c. Canadian content on the AM radio networks, English and French, was about 75 p.c. The time given to colour programming in a normal week's schedule ranged from 70 to 84 p.c. on the English television network and from 49 to 79 p.c. on the French network.

Regional participation in national program schedules and planning was considerably increased in both French and English services. There was also a greater emphasis on community service by individual CBC stations, with the assignment of more local periods in the French services and the introduction of new morning radio formats on a number of English stations. The Frontier Coverage Package schedule was revised to improve program service to northern viewers.

Following a major internal study of CBC radio, the CBC Directors approved proposals for the gradual realignment of programming into complementary AM and FM services in both English and French. In each language, Radio One (AM) would emphasize news, information, community programming and light entertainment; Radio Two (FM) would offer more extended program formats concentrating on music, the arts and documentary material. A summary of this long-range plan was presented to the Parliamentary Committee on Broadcasting, and applications were submitted to the CRTC for authority to establish additional FM stations.

\* Revised by CBC Information Services, Ottawa.

The CBC continued to be the major developer and employer of Canadian talent, engaging some 30,000 Canadian artists and performers at total fees of \$21,600,000.

The CBC Research Department continued its weekly surveys of audience reaction to French and English television programs, and also conducted a variety of special studies on subjects such as the impact of cable television, public feeling on topical social issues, radio listening habits, and the analysis of coverage and market data.

**Facilities and Coverage.**—As of Mar. 31, 1971, 98.6 p.c. of Canadians were within reach of CBC radio and 96.8 p.c. could receive CBC television. Coverage extensions brought the total length of CBC radio networks to 28,060 miles, and of CBC television networks to 11,452 miles. New installations during the year included five new television transmitters, 22 new radio transmitters, and one new Frontier Coverage Package (CBC-designed transmitter for isolated locations offering limited program service on tape).

During 1970, an ultra high frequency education station came into operation in Toronto, owned and operated by CBC and programmed by the Ontario Department of Education. The CBC acquired part ownership of CKLW-TV in Windsor, Ont., with completion of the purchase scheduled for 1973-74. Work was in progress on a new CBC television station in Saskatoon, Sask., scheduled to go on the air in the fall of 1971. In radio, the CBC's Toronto FM station was converted to stereo operation in December 1970, and the two Montreal FM stations, English and French, were converted in 1971.

Work was well advanced on the CBC's new Montreal broadcasting centre at Place de Radio-Canada, with first occupancy expected in late 1971 and full operation during the course of 1972. Regional production facilities were expanded at Moncton, N.B., and plans were in progress for consolidated facilities in Vancouver, B.C.

Discussions were continued with Telesat Canada regarding CBC plans to lease channels on the domestic communications satellite *Anik*, scheduled to be in operation in 1973. The CBC's position on cable television and its place in the Canadian broadcasting system was set out in a brief to the CRTC.

**Organization.**—Reorganization of the CBC, in progress since 1968, was almost completed by early 1971, with English-language operations centred in Toronto under the English Services Division, French-language operations in Montreal under the French Services Division, and foreign operations, including Radio Canada International, grouped under the External Services Division. A new management information system was in operation, to facilitate program planning and production. The total number of CBC employees as of March 1971 was 8,872, a slight reduction from the previous year.

**External Operations.**—The 11 language sections of Radio Canada International transmit 85 hours a week of shortwave programs to Europe, Africa, Latin America, Australasia, the Caribbean and the United States. Some 80,000 audience letters are received each year, and the international membership of the Radio Canada Shortwave Club reached 10,000 in 1970. The international service also continues to supply music and spoken word transcriptions to foreign broadcasting organizations.

In February 1971, Radio Canada International observed the 20th anniversary of its shortwave broadcasts in Russian. In June 1971, a special Canadian postage stamp was issued marking the installation of two of the planned five new 250-kw. transmitters at Sackville, N.B. Also in 1971, the CBC's shortwave receiving station near Ottawa was moved to a new and larger site at Stanley Corners.

CBC continued its active association with international organizations such as the Communauté des Télévisions Francophones, the Communauté radiophonique des Programmes de langue française, the Commonwealth Broadcasting Conference, the European Broadcasting Union and the Asian Broadcasting Union. A variety of program exchanges and co-productions were arranged, the CBC hosted or attended several international workshops and conferences, and the External Services Division provided liaison in preparation for CBC coverage of coming world events such as the 1972 Olympics in Japan and

Germany. The CBC received a number of foreign broadcasters on training attachments in co-operation with the Canadian International Development Agency, UN agencies and foreign broadcasting organizations.

The Foreign Sales Department of the CBC placed a variety of French and English productions with broadcasters in the United Kingdom, the Netherlands, Germany, Sweden, the United States, New Zealand, Japan, Australia, France, Belgium, Switzerland and Monaco. Among international awards won by CBC productions were the Grand Prix de l'Actualité, presented by the Communauté radiophonique des Programmes de langue française for a radio report on the liberation of James Cross; Ohio State Awards for educational radio programming were received for *Indians of North America* and *A Many-Colored Canvas*; Major Armstrong Awards for excellence and originality in FM programming; and a certificate of recognition from the Association for Children with Learning Disabilities (U.S.A.) for general programming in this field.

CAE, the Canadian Armed Forces radio station operated by CBC personnel at Werl, Federal Republic of Germany, was closed in 1970 when Canadian NATO forces were consolidated at Lahr. Station CFN at Lahr continued in operation and began broadcasting in both English and French.

**Finance.**—Total operating expense for the year ended Mar. 31, 1971, was \$218,139,000, an increase of \$10,106,000 or 4.9 p.c. over the previous year; this amount included \$11,034,000 for depreciation and amortization not recoverable from the Parliamentary payment. An amount of \$47,466,000 was obtained from revenue (mostly advertising revenue which grossed \$45,061,000), a \$1,400,000 decrease from the previous year. Of the total Parliamentary payment of \$166,000,000, an amount of \$159,700,000 was applied to meet net operating expenditures, and \$6,300,000 was applied to repayment of capital loans; the surplus of \$61,000 was carried forward to meet future operating expenditures. Capital assets, after accumulated depreciation, totalled \$132,586,000.

As a Crown corporation, the CBC continued to be affected by Government restraints and operated the national broadcasting service in 1970-71 within the Parliamentary pay-

Radio Canada International's new monitoring station near Ottawa features an aperiodic loop antenna system made up of three arrays of eight loops each. Two are set in space diversity for pick-up of programs from Europe and the third directed to Africa.

ment of \$166,000,000, which was the same as the amount provided in the previous year. The Corporation was able to meet increased operating costs and cover-off reduced advertising revenue and, at the same time, generate a small surplus of \$61,000 for the year. This was added to previous year's surplus, and a total of \$13,016,000 was carried forward to subsequent fiscal years. The surplus is available to assist in meeting rising costs as well as additional Canadian programming requirements.

#### Statistics of the Broadcasting Industry\*

Financial and other statistics of the radio and television broadcasting industry are obtained by Statistics Canada in co-operation with the Canadian Radio-Television Commission; summary figures for private and CBC sectors are given in Table 9 for the year 1970.

In 1970, 338 private radio stations and 66 television stations reported to Statistics Canada. The operating revenue of the broadcasting industry for the year amounted to \$263,292,561, an increase of 6.6 p.c. over 1969. Of the total, radio broadcasting accounted for \$116,423,211 or 44.2 p.c. and television broadcasting for \$146,869,350 or 55.8 p.c.; in 1969, radio received \$109,907,435 or 44.5 p.c. and television \$137,141,456 or 55.5 p.c. Revenue from national and network time sales represented 60.7 p.c. of the total broadcasting revenue and revenue from local time sales 39.3 p.c.; national and network time sales increased by 6.2 p.c., local time sales by 4.9 p.c. and other incidental operating revenue by 20.3 p.c. over 1969. Operating expenses in 1970 at \$397,157,255 were 5.5 p.c. higher than in 1969. The growth of revenues exceeded the growth of expenses and resulted in an operating profit of \$30,842,306 in 1970 compared with one of \$36,623,163 in 1969. After adjustment on account of other income and expenses and income taxes, the final net profit of the private sector of the broadcasting industry in 1970 was \$13,758,994 compared with \$17,744,962 in 1969.

\* Prepared by the Transportation and Public Utilities Division, Statistics Canada.

<sup>3</sup> The CBC charges its operations with depreciation. The charge so made has been added to the Parliamentary grants.

**Statistics of the Community Antenna Television Industry.**—Table 10 presents financial statistics of an annual series dealing with the Canadian CATV industry. It should be noted that the series was re-designed for 1970 so that the resulting statistics are not comparable with those published in the 1970-71 Year Book.

This industry, comprising 314 operating systems, reported an increase in total operating revenue for the year ended Aug. 31, 1970 of 46.8 p.c., rising from \$37,400,000 to \$54,900,000 over that for the previous year. Subscription revenue from individual subscribers and multi-outlet contracts accounted for \$51,700,000 or 94.2 p.c. of the total. Operating expenses rose from \$22,200,000 (adjusted to exclude interest and depreciation for purposes of comparability) to \$30,300,000 in 1970, resulting in a net operating profit of \$24,700,000 compared with one of \$15,200,000 in the previous year. After deducting "other revenue net of other expenses", "net loss derived from activities not related to CATV" and "estimated income taxes", the industry achieved a net profit to Aug. 31, 1970 of \$5,100,000 compared with one of \$2,300,000 earned in the previous year.

### Section 3.—The National Film Board\*

The National Film Board, an agency of the Federal Government, was established by Act of Parliament in 1939 and reconstituted by the National Film Act in 1950—its function, "to initiate and promote the production and distribution of films in the national interest". The Board's films are produced in Canada's two official languages and, during the 32 years of production, have made a considerable contribution to the country's culture and to the national identity.

\*Statistics relating to the over-all motion picture industry in Canada are given in Chapter XX, pp. 1002-1004.

In addition to 35mm and 16mm films, the Board produces and distributes other visual aids materials—filmstrips, 8mm loop films, slide sets, overhead projectuals, multi-media kits and photo stories. A recent contract provides for release of some 100 NFB films in the new EVR (electronic video-tape recording) format for television viewing.

The growing sophistication of film audiences and the increasing importance of film as a means of communication are reflected in the nature of films produced—features, documentaries, informational films, films for the specific needs of government departments, and films designed for particular social purposes. The Board strives to serve as innovator of new cinema techniques, as well as a recorder of the nation's day-to-day evolution. Thus, new needs and greater public sensitivity have encouraged the Board's film-makers to explore new film styles and to experiment in new areas of film production. There have been corresponding new departures in the distribution and use of films, as more people turn to films as a matter of course for information and assistance in many activities.

In Canada, the Board's productions are distributed through community outlets, schools and universities, television stations, theatres and commercial sales. In all of these areas annual figures show a steady and, in some instances, a marked increase. A large part of the 16mm community film audience is reached through film libraries, film councils and special interest groups. The growing appetite for films can be attributed to the wide range of subject matter available. The Board's catalogue, produced by its Publicity Division, lists some 60 main and sub-categories. Original films are shown regularly over English-language and French-language television networks in Canada as well as in cinemas.

NFB film distribution outside Canada also continues to increase. The Board's films are seen at most of the world's international film festivals with gratifying response from the judges, film critics and the audiences. Film distribution abroad is promoted by the Board's offices in New York, London, Paris, Buenos Aires, New Delhi and Tokyo, and by posts of the Departments of External Affairs and of Industry, Trade and Commerce. The aggregate audience of films loaned by the Department of External Affairs in some 80 countries was in 1971 in excess of 65,000,000 people. NFB films are shown in theatres of some 100 countries. To increase the usefulness of films about Canada abroad, the Board makes foreign-language versions of some films in 40 or more languages. Language versions are also made under contract with television networks and school film distributors in other countries. The Board co-operates with the Canadian Travel Bureau to distribute films in support of Canada's travel industry to appropriate audiences in the United States, Europe and other areas. The total audience of Canadian travel films shown abroad in 1971 was close to 14,000,000, of which 12,000,000 were in the United States.

The Board, in its mandate to "interpret Canada to Canadians and to the rest of the world", seeks to reflect the interests of the Canadian people and those shared with other people around the world. The fact that demand for the Board's films grows by about 33 p.c. a year indicates that this mandate is being fulfilled.

## Section 4.—Postal Service

The basic tasks of the Canadian Postal Service are to receive, convey and deliver postal matter with speed and security, for which duties it maintains thousands of post offices and utilizes air, rail, road and water transportation facilities. Associated functions include the sale of stamps and other articles of postage, the registration of letters and other mail for dispatch, the insuring of parcels, the accounting of COD articles and the transaction of money-order business. Also, because of its transcontinental facilities, the Post Office assists other government departments with such tasks as selling unemployment insurance stamps and hunting permits, collecting government annuity payments, distributing income tax forms and Public Service employment application forms, and displaying government posters.

Post offices are established wherever the population warrants. Those in rural areas and small urban centres transact all the functions of a city office. In larger urban areas,

postal stations have full functions similar to the main post office, including general delivery service, lock-box delivery and letter-carrier delivery. Much sophisticated automatic equipment has been installed in Canada's larger post offices, which could be described as complex semi-automated plants. Such devices include conveyors and chutes, parcel and bag sorting machines, photo-electric counters, intercom systems, observation gallery telephone systems and industrial music. Outside the post office building, mailmobiles, automatic stamp-vending machines and curbside mail boxes are in use.

The operating service of the Post Office Department is organized into four regions, each headed by a General Manager reporting directly to the Deputy Postmaster General. The regions are further divided into districts, each headed by a District Director. The operating and support functions required in the provision of postal service to the public are the responsibility of the local postmasters who receive technical and administrative assistance from district and regional offices at strategic points.

Postal service is provided in Canada from Newfoundland to the west coast of Vancouver Island and from Pelee Island, Ont., in the south, to settlements and missions far into the Arctic. Canada's airmail system utilizes most transcontinental flights, supported by many branch and connecting lines, and links up with the United States domestic and other international airmail systems. First-class domestic mail is carried by air between Canadian points, whenever delivery can thus be expedited. Air stage routes provide an all-class mail service to many northern areas which can be served only by air. There are over 46,000 miles of airmail and air stage routes.

At Mar. 31, 1971, there were 8,994 post offices in operation; letter-carrier delivery was being provided in 241 urban areas and 5,161 private contractors were delivering mail to 775,017 rural and suburban households. In 1971, there were 637 city mail services transporting mail between post offices and postal stations, collecting mail from street letter boxes and delivering parcel post, and some 382 side services were transporting mail between post offices and railway stations, wharves and airports. Intercity transportation of mail by highway motor vehicles was being conducted by 635 major services, complemented by 951 feeder or stage services operating to and from smaller centres. Although many of the highway services have replaced rail for the transportation of mails, rail remained the principal mode for long-distance movements of other than first-class matter.

Revenue and expenditure of the Post Office Department for the five years ended Mar. 31, 1970 are shown in Table 11; gross revenue receipts are received mainly from postage, either in the form of postage stamps and stamped stationery, or postage meter and postage register machine impressions. Some postage is also paid in cash without stamps, stamped stationery or meter and register impressions. During the year, 44,594,066 money orders were issued having a value of \$938,682,250, of which \$912,408,724 was payable in Canada and \$26,273,525 was payable in other countries. The value of money orders issued in other countries and payable in Canada was \$8,463,315.

**11.—Revenue and Expenditure of the Post Office Department, Years Ended Mar. 31, 1967-71**

Year Ended Mar. 31—	Revenue	Expenditure	Deficit
	\$	\$	\$
1967.....	305,400,000	353,100,000	47,700,000
1968.....	337,023,000	404,214,000	67,191,000
1969.....	374,902,000	465,233,000	90,331,000
1970.....	444,069,000	497,017,000	52,948,000
1971.....	432,900,000	533,400,000	100,500,000

## Section 5.—The Press\*

The freedom of the public in Canada is strenuously exercised by an omnipresent press. Daily newspapers published in the country in 1971 numbered 120, counting morning and evening editions separately. Combined circulation was about 4,692,000—82 p.c. in English and 18 p.c. in French. Publishers' surveys show that each newspaper is read by an average of three persons.

Daily newspaper advertising revenue in 1970 was \$301,392,000 and circulation revenue was \$109,978,000. By comparison, advertising revenue of 338 private radio stations in Canada in 1970 was \$111,813,000 and of 66 private television stations \$95,907,000. In 1971, there were 14 daily newspapers that had a circulation in excess of 100,000, accounting for 54 p.c. of total circulation. There were 12 dailies published in the French language, 10 of them located in Quebec. Although the circulation of daily newspapers blankets the more populous areas well beyond publishing points, smaller cities and towns and rural areas are also served by 822 weekly newspapers catering to local interests and exercising important local influence. The Canadian society is also enriched by 87 ethnic daily or weekly newspapers published in many languages, often sprinkled with English.

About 60 p.c. of Canada's daily newspapers are privately owned or independent. There are three major newspaper chains in the country, owned by Southam Press Ltd. (10 dailies), Thomson Newspapers Ltd. (27 dailies) and FP Publications Ltd. (eight dailies). Both Southam and Thomson Newspapers are publicly owned companies with shares traded on Canadian stock exchanges. Papers in the Thomson chain are concentrated in the smaller cities. FP accounts for about 19 p.c. of total daily circulation, Southam for 18 p.c. and Thomson for about 8 p.c.

In addition to their own news-gathering staffs and facilities, Canadian newspapers subscribe to a number of syndicated agencies and wire services, the largest being The Canadian Press which is a co-operative agency owned and operated by Canadian dailies. Largely by teletype and wirephoto transmission, it provides its 104 member newspapers with world and Canadian news and also serves weekly newspapers and radio and television stations. CP has its own news-gathering staff and each member newspaper provides the agency with important local news for transmission to fellow members and members share the cost in ratio to their circulations.

CP carries world news from Reuters (the British agency), from The Associated Press (the United States co-operative) and from Agence France-Presse (of France) and these agencies are offered CP news on a reciprocal basis. CP maintains a French-language service in Quebec.

United Press International of Canada, the second major news wire service in Canada, is a private company and a part of United Press International World Service. It provides Canadian and international news and pictures to about 40 subscribers in Canada and is an outlet for Canadian news through United Press International facilities throughout the world. Certain foreign newspapers maintain bureaus in Ottawa and elsewhere in Canada to collect and interpret Canadian news.

**Press Statistics.**—The following tables are based on data estimated from *Canadian Advertising*. Circulation figures are given for daily English-language and French-language newspapers only. Such circulation figures are relatively easy to obtain because, in their own interest, newspapers qualify for and subscribe to the Audit Bureau of Circulation. For these, ABC 'net paid' figures have been used; 'controlled' (free) distribution newspapers are not included. On the other hand, circulation data for foreign-language newspapers, weekly newspapers, weekend newspapers and magazines are incomplete and therefore not usable.

\* An article in the 1957-58 Year Book traces developments in Canadian journalism from their beginnings in 1752 to (circa) 1900. A second article appearing in the 1959 edition brings that account up to 1958.

**Revenue from Printing and Publishing.**—One of the industrial groups for which information is collected by Statistics Canada in its annual Census of Manufactures is the printing, publishing and allied industries group which includes establishments engaged primarily in the publishing and printing of newspapers, magazines, periodicals, books, almanacs, maps, guides and the like, as well as establishments printing such publications for publishers, publishing firms that do no printing, and engraving, stereotyping and allied industries. Of interest in connection with press statistics is the amount of revenue received by these industries from advertising and from subscriptions or sales, which is given for the years 1968 and 1969 in Table 16. Additional data on manufacturing activity of this industrial group are included in Chapter XV on Manufactures.

## PART I.—THE MOVEMENT AND MARKETING OF COMMODITIES

Domestic trade is broad in terms of scope, complex in terms of activity, and volatile in the forms it takes. It encompasses all values added to commodities by agencies and services connected with the warehousing, distribution and sale of goods within each province as well as between provinces. Domestic trade is engaged in or facilitated by manufacturers, wholesale and retail establishments, mail-order houses, service trades, warehouse operators and other distributors, and by such "outside" agencies as banks, insurance companies, railway and trucking companies, advertising agencies and market research houses. It should be noted, however, that the use of the term "domestic trade" should not be interpreted as meaning that all business activities undertaken by Canadian businesses are limited to the boundaries of Canada. For example, wholesalers (who occupy a prominent position in domestic trade) are often engaged in import and export activities.

In recent years, a considerable degree of interest and speculation has been focused on the service trades, which embrace a wide spectrum of activities engaged in by professional, business and personal service establishments. Included also are the amusement and recreation services, which include regular and drive-in movie theatres, bowling alleys, health

clubs, golf courses, race tracks and other sports activities, and the fast-growing accommodation and food service fields, comprising hotels, motels, tourist facilities, restaurants and drive-in "fast food" outlets.

The degree of interest being shown in the services field is further indicated by the number of trades surveyed for the first time in the 1971 Census. These include, in the amusement and recreation services group, marinas, ski-facility operators, driving ranges and miniature golf courses; and, in the business services group, computer services, media representatives, architects, professional engineers and other engineering and scientific services, lawyers and notaries, and management and business consultants. However, services provided by doctors, dentists, nurses, hospitals and educational institutions remain outside the scope of the Census of Merchandising and Services.

Only certain phases of the broad and ever-widening field of domestic trade (mainly the retail, wholesale and service trades) are covered in this Chapter but, wherever possible, references are given to related material appearing elsewhere in this publication. The arrangement of material in a volume such as the Year Book is governed by the necessity of interpretation from various perspectives. The Index will be found useful in this respect.

## Section 1.—Merchandising and Service Businesses\*

Data on merchandising and service activities are derived principally from a periodic census (or full-coverage survey) of the businesses engaged in such activities. The first census was taken in 1931, followed by similar censuses in 1941, 1951 and 1961. The reports for 1961, which provided a wider range of data than any previous census, contained information on sales, inventory and credit; gross margins and operating expenses; small geographic area data; and, for "establishments" only (see footnote \*, p. 931), an analysis of sales by commodities.

The 1961 Census marked the end of the decennial census program. Commencing with 1966, the censuses of merchandising and service establishments became part of a quinquennial series in order to provide more frequent survey benchmarks and to enable publication of more up-to-date statistics than was previously possible. Subsection 1 lists the various reports produced as a result of the 1966 Census of retail and service trades and provides summary data from a special study based on the 1966 Census of wholesale trade. In the 1971 Census, the data requirements—because of greatly increased demands for information from the public and private sectors—will be considerably more detailed than at any time in the past; results of this census will begin to be available during 1973.

Each census, as it is completed, forms a new base for the various intercensal (monthly, quarterly and annual) surveys of retail, wholesale and service trades; some are sample surveys and others are carried out on a full-coverage basis. Subsection 2 contains current intercensal information obtained as a result of these surveys, relative not only to the distributive trades but to other statistical series (i.e., consumer credit) as well. It should be noted that all of these data are on the 1966 base.

### Subsection 1.—1966 Census of Merchandising and Services

#### Retail and Service Trades

Previous editions of the Year Book have included the principal statistics derived in the 1966 Census of retail and service trades. Much of this information may also be obtained in a more concise form in the *Market Research Handbook*, 1969 edition (Catalogue No. 63-514). Specific data may be obtained in one or more of the following reports.

\* Prepared (February 1972) in the Merchandising and Services Division, Statistics Canada.

## VOLUME VI.—RETAIL TRADE

- 97-601 *Introduction and General Review*—Description of the Census, definitions of terms used, analysis of results and samples of questionnaires, etc. (72 pp., \$1)

## LOCATION STATISTICS\*

- 97-602 *Provinces and Cities by Kind of Business*—Retail trade, by kind of business, for Canada and the provinces, 1966; retail trade, by kind of business, for census metropolitan areas, major urban areas, and other cities of 30,000 population and over, 1966; retail trade, by kind-of-business group and selected trade, for Canada and the provinces, 1961 and 1966. (136 pp., \$1.50)
- 97-603 *Counties or Census Divisions, Cities and Towns*—Retail trade, by county or census division and incorporated place of 1,000 population and over, 1966; retail trade, by kind-of-business group and selected trade, for counties or census divisions, 1966; retail trade, by kind-of-business group, for incorporated places of 2,000 population and over, 1966; retail trade, by kind-of-business group and selected trade, for incorporated cities of 30,000 population and over, 1966. (188 pp., \$1.50)
- 97-604 *Metropolitan Areas by Census Tract*—Retail trade, metropolitan areas and other cities, by kind-of-business group, by census tract, 1966. Includes maps of census tracts in metropolitan areas. (60 pp., 75 cents)
- 97-605 *Size of Business*—Retail trade, by annual sales size, by kind of business, for Canada and the provinces, 1966; retail trade by employment size, by kind-of-business group, for Canada and the provinces, 1966; retail trade by ownership size, by selected trade, for Canada and the provinces, 1966; retail trade by ownership size, by selected trade, for census metropolitan areas, major urban areas, and other cities of 30,000 population and over, 1966. (190 pp., \$2)
- 97-606 *Miscellaneous Data*—Retail trade, by form of organization, by kind-of-business group, for Canada and the provinces, 1966; retail trade, receipts from the sale of meals and lunches, by kind-of-business group and selected trade, for Canada and the provinces, 1966; retail trade, estimated receipts from repairs and services, by kind-of-business group and selected trade, for Canada and the provinces, 1966. (28 pp., 50 cents)

## ESTABLISHMENT STATISTICS\*

- 97-607 *General Statistics*—Retail establishments, by kind of business, for Canada and the provinces, 1966; retail establishments, sales by class of customer, by kind-of-business group and selected trade, for Canada and the provinces, 1966; retail establishments, accounts receivable, by kind of business, for Canada and the provinces, 1966. (58 pp., 75 cents)
- 97-608 *Analysis of Sales by Commodity*—Retail establishments, percentage distribution of sales by main merchandise lines for selected kinds of business, for Canada and the provinces, 1966. (60 pp., 75 cents)

## VOLUME VII.—SERVICE TRADES

- 97-641 *Introduction and General Review*—Description of the Census, definitions of terms used, analysis of results and samples of questionnaires, etc. (60 pp., 75 cents)

## LOCATION STATISTICS\*

- 97-642 *Provinces and Cities by Kind of Business*—Services, by kind of business, for Canada and the provinces, 1966; services, by kind of business, for census metropolitan areas, major urban areas, and other cities of 30,000 population and over, 1966; services, by kind-of-business group and selected trade, for Canada and the provinces, 1961 and 1966. (136 pp., \$1.50)
- 97-643 *Counties or Census Divisions and Places of 1,000 Population and Over*—Services, principal statistics, by county or census division and incorporated places of 1,000 population and over, 1966; services, by kind-of-business group and selected trade, for counties or census divisions, 1966; services, by kind-of-business group and selected trade, for incorporated cities of 30,000 population and over, 1966. (148 pp., \$1.50)
- 97-644 *Metropolitan Areas by Census Tracts*—Services, metropolitan areas and other cities, by kind-of-business group, by census tract, 1966. Includes maps of census tracts in metropolitan areas. (60 pp., 75 cents)

## VOLUME VII.—SERVICE TRADES—concluded

Catalogue  
No.

## LOCATION STATISTICS—concluded

- 97-645 *Size of Business and Miscellaneous Data*—Services, by annual receipts size, by kind of business, for Canada and the provinces, 1966; services, by employment size, by kind-of-business group, for Canada and the provinces, 1966; services, by ownership size by selected trade, for Canada and the provinces, 1966; services, by form of organization, for Canada and the provinces, 1966; services, receipts from the sale of meals and lunches, by selected trade, for Canada and the provinces, 1966. (96 pp., \$1)

## ESTABLISHMENT STATISTICS\*

- 97-647 *General Statistics*—Service establishments, by kind of business, for Canada and the provinces, 1966; percentage distribution of source of receipts for reporting service establishments, by kind of business, for Canada and the provinces, 1966. (52 pp., 75 cents)

## Wholesale Trade

The 1966 Census of wholesale trade (see *Wholesale Trade, Establishments, 1966*, Catalogue No. 97-627) measured the aggregate business conducted by all wholesalers operating in Canada, whether Canadian or foreign-owned and whether their sales were domestic or international. The total volume of trade measured is not identical with the value of goods passing through the wholesale sector of the economy; at times, wholesale firms sell to each other and thus the value of the same merchandise may be recorded twice or more in the total volume of wholesale trade.

For the purpose of the 1966 Census, wholesalers were stratified in two ways—into five *types of operations*, as described in Table 1, and into over 150 *kinds of business* within each type of operation, as shown in Table 2. A limited comparison with 1961 Census data, based on kind-of-business “groups” is shown in Table 3. It should be noted that the results of the 1966 Census of wholesale trade were not published for trading locations—as in previous censuses—but only for *establishments*\* within *regional* boundaries.

\* For the purpose of the census, a *location* is defined as “a recognizable place of business in which the principal activity is the display and sale of goods or services to the general public for personal or household consumption”. In other words, the location series provides aggregate data on the physical locations in which retailing or service activities actually take place. The *establishment*, on the other hand, is “the smallest unit which is a separate operating entity capable of reporting those elements of input and output necessary to the calculation of gross margin, as well as employment, wages and salaries”. The location is *not* dependent on the system of accounting; the establishment is.

Wholesale trade in Canada rose from \$19,740,000,000 in 1961 to nearly \$31,172,000,000 in 1966, an increase of 57.9 p.c. or approximately 11.6 p.c. each year over the five-year period. (By way of comparison, retail trade increased 41.1 p.c. over the same period.) The largest increases during 1961-66 took place in the paper and paper products group (+197.7 p.c.), the amusement, sporting and photographic goods group (+165.8 p.c.), and the metals and metal work group (+106.2 p.c.). At the same time, the farm products group rose by only 24.7 p.c. and the hardware group by only 20.7 p.c.

## Subsection 2.—Intercensal Surveys of Retail, Wholesale and Service Trades

## Retail Trade

The trend of retail trade is one of the most accurate barometers of the economic health and well-being of the nation. In 1970, retailers absorbed 52.0 p.c. of personal disposable income available to Canadians and accounted for 56.9 p.c. of total personal expenditure on consumer goods and services. The value of retail sales, estimated from intercensal sample surveys (and revised every five years to a new census base\*), increased by 22.8 p.c. during the period 1966-70.

The current retail trade series shown in Table 4 reflects the many definitional changes adopted for use in the 1966 Census. A new classification, "grocery, confectionery and sundries stores", is included in the "grocery and combination stores" series; on the other hand, "home and auto supply stores" and "accessories, tire and battery stores" remain part of the "all other stores" category. The department store definition was altered significantly,\* affecting not only the department store series but the variety store, general store and "all other" store series as well. Also, a new kind of business—general merchandise stores—was taken out of the miscellaneous stores grouping and established as a separate series, commencing in 1966.

4.—Retail Trade, by Kind of Business and by Province, 1966-70

**Chain† and Independent Stores.**—Within the framework of retail trade, chains and independent retailers compete to achieve or retain a viable share of the total market. In

\* Details of intercensal revisions may be found in *Retail Trade, 1961-69* (Catalogue No. 63-517) and in *Retail Trade, Revisions to 1966-70 Postcensal Estimates* (Catalogue No. 63-519).

† A retail chain is defined by Statistics Canada as "an organization operating four or more retail stores in the same kind of business under the same legal ownership". A concession located in a department store is not considered to be a store location for the purpose of this definition.

some kinds of business, such as motor vehicle dealers, service stations and garages, food stores other than grocery and combination stores, and men's clothing stores, independent merchants have maintained a dominant position; in others, such as department stores, variety stores and general merchandise stores, chains account for the largest proportion of sales. In recent years, changes in market share have been most pronounced among women's clothing stores, grocery and combination stores, family clothing stores, hardware stores and men's clothing stores. The constantly shifting balance between chain and independent stores is shown in Tables 5 and 6.

**Department Stores.**—In 1970, department stores accounted for a higher proportion of total sales than most other kinds of retail business—exceeded only by grocery and combination stores and motor vehicle dealers. Their sales of \$2,852,320,000 represented 10.2 p.c. of *total* retail trade and 13.2 p.c. of the business done by competing firms (all trades other than motor vehicle dealers, fuel dealers and parts of the “all other stores” classification). Department store sales in 1970 were 44.5 p.c. higher than in 1966, the largest increase among the 18 specified kinds of business (see Table 4). However, growth among the various departments within department stores has not been consistent, as Table 7 shows.

**7.—Department Store Sales, by Department, 1966 and 1970**

<sup>1</sup> Based on extrapolations of original published data.

**Voluntary Group Stores.**—In order to stem the continuing encroachment of chains and department stores on their share of the market, independent retailers in a variety of trades have turned increasingly toward affiliation with a voluntary group organization. Through such group affiliation, independent businessmen have been afforded the opportunity to enjoy many, if not all, of the advantages accruing to chain store firms—mass purchasing power, centralized buying, lower per-unit advertising costs and a number of important management services. As sponsors and/or suppliers of many voluntary groups, wholesalers have also benefited, particularly through the streamlining of their selling and order-filling systems.

For a number of years (since 1964), Statistics Canada has carried out surveys of voluntary group stores in a wide range of retail trades. Commencing with the 1969 survey, however, the retail "universe" was split into two parts (stores affiliated with food wholesalers, and stores affiliated with other than food wholesalers) and a third sector was added (affiliated or franchised businesses in the service trades). Each sector will be surveyed in succeeding years, with the entire retail and service trade universes being covered over a three-year period. The 1969 survey applied to stores in the first sector—those affiliated with food wholesalers.

The results of the 1969 undertaking (Table 8) are not entirely conclusive, at least in the chain sector, due to classification changes that were made between 1968 and 1969. If, for example, sales of affiliated chain stores had actually increased at the same rate as in the previous year, the growth in sales over the entire 1967-69 period would have been: for affiliated chains, +21.8 p.c. and for non-affiliated chains, +18.3 p.c.—in both cases, less than the 22.5-p.c. increase experienced by affiliated independents. As concerns the independent sector, the trend of earlier years has continued; affiliation in a voluntary group has been decidedly advantageous but it has not completely stemmed the continuing growth and increasing market share of chain store organizations.

#### 8.—Sales of Grocery and Combination Stores, Affiliated and Non-affiliated, 1967-69

NOTE.—Grocery and combination stores include: grocery stores with less than 15 p.c. fresh meat; combination stores (i.e., groceries, produce and meat); and grocery, confectionery and sundries stores.

Form of Organization	1967	1968	1969	Percentage Change 1967-69
	\$'000	\$'000	\$'000	
Corporate chain stores.....	2,610,726	2,805,616	3,101,212	+18.8
Affiliated.....	331,545	365,916	258,649 <sup>1</sup>	-22.0
Non-affiliated.....	2,279,181	2,439,700	2,842,563	+24.7
Independent stores.....	3,074,787	3,179,973	3,299,730	+ 7.3
Affiliated.....	1,579,197	1,801,737	1,933,927	+22.5
Non-affiliated.....	1,495,590	1,378,236	1,365,803	- 8.7
<b>Totals, All Stores.....</b>	<b>5,685,513</b>	<b>5,985,589</b>	<b>6,400,942</b>	<b>+12.6</b>

<sup>1</sup> The decline from 1968 is attributable to the reclassification of a number of chain store organizations from affiliated to non-affiliated status.

**New Motor Vehicle Sales.**—The largest homogeneous group of commodities sold within the confines of retail outlets is embodied in the classification "new motor vehicles". In the only current\* survey of retail trade carried on at the commodity level (all others are based on "kind of business"), new motor vehicles are taken to include private passenger cars and taxis, trucks, buses and other commercial vehicles sold at retail. As shown in Table 9, sales of new motor vehicles in 1970 decreased to \$2,812,330,000, based on the actual cost to purchasers (prior to 1967, the data were based on manufacturers' suggested list prices). The decline in new motor vehicle sales (15.4 p.c. below the 1969 level) is believed

\* Statistics Canada also produces—on an occasional basis (at present, once every five years)—a comprehensive report on all commodities sold in retail outlets. The most recent publication, *Retail Commodity Survey, 1968* (Catalogue No. 63-518), was released in February 1971.

### COMPARISON OF CANADIAN PASSENGER CAR UNIT SALES OF OVERSEAS MANUFACTURED CARS WITH THOSE MANUFACTURED IN CANADA AND THE UNITED STATES, 1961-70

### MARKET SHARE OF OVERSEAS MANUFACTURED AND CANADIAN AND UNITED STATES MANUFACTURED PASSENGER CARS, PERCENTAGES BASED ON UNIT SALES IN CANADA, 1961-70

to have been primarily the result of unsettled economic conditions which prevailed during this period and which heavily influenced the sale of high-priced consumer goods.

### 9.—Retail Sales of New Motor Vehicles, 1961-70

In recent years, the sales of overseas-manufactured vehicles—both passenger cars and trucks—have been increasing at a faster rate than those of Canadian and United States manufacture. In addition, the share of the new motor vehicle market held by overseas manufacturers has been rising apace; 1970 was the fourth consecutive year of growth in the market share of new overseas vehicles. Table 10 shows new motor vehicle sales, by type of vehicle and by source of origin, for 1969 and 1970. It will be noted that one out of every five new vehicles sold during 1970 was an overseas-built model, and that nearly one seventh of Canadian sales dollars went toward the purchase of such models.

### 10.—Retail Sales of New Motor Vehicles, by Type and Source, 1969 and 1970

Type of Vehicle and Source	Units			Retail Value

**Non-store Retailing.**—Consumer goods, in addition to being sold in retail stores, often reach the household user through other more direct channels of distribution—commonly described as “direct selling”. These channels are characterized by the fact that the commodities handled bypass the retail outlet completely in moving from manufacturer to distributor to household consumer. Statistics Canada periodically carries out surveys of two distinct forms of direct selling—merchandise sales of vending machine operators, and of manufacturers and distributors specializing in direct-sales methods.

**Vending Machine Operators.**—This survey is designed to measure the value of sales made through automatic vending machines owned or operated by vending machine firms, including soft drink bottlers engaged in vending activities on a regular year-round basis. In 1970, such sales reached a new high of \$156,822,100, 9.7 p.c. above the 1969 total of \$142,909,600. The 1970 sales were recorded by 768 vending machine operators through 107,652 automatic merchandising machines, including 1,403 microwave and infra-red ovens and 2,498 coin and bill changers.

## 11.—Vending Machine Operators, 1961-70

Year	Firms	Machines <sup>1</sup>	Sales
	No.	No.	\$
1961.....	579	65,028	44,959,700
1962.....	600	73,397	57,799,200
1963.....	673	78,477	67,580,000

1968.....	791	98,691	127,058,600
1969.....	..	104,078	142,909,600
1970.....	768	107,652	156,822,100

<sup>1</sup> From 1966 on, includes microwave and infra-red ovens and coin and bill changers.

Although vending machines can be used to distribute many types of commodities, the largest proportion of sales has been accounted for consistently by three main lines—tobacco products, hot drinks, and cold drinks vended in bottles, cans, cartons and disposable cups. In 1970, sales in these three product areas amounted to \$125,234,900, an increase of 9.8 p.c. over the 1969 total. However, the over-all importance of tobacco products, hot drinks and cold drinks is declining. In 1960, these commodities accounted for 87.4 p.c. of all merchandise sold in vending machines; by 1970, this proportion had fallen to 79.8 p.c. Among commodities sold in vending machines, packaged confectionery showed the largest increase in market share from 1969 to 1970.

## 12.—Value and Percentage Distribution of Sales by Vending Machine Operators, by Product, 1969 and 1970

Product	1969		1970	
	Sales	Percentage of Total	Sales	Percentage of Total

*Direct Selling by Manufacturers and Specialist Agencies.*—The first survey of direct selling, covering manufacturers and selected agencies specializing in direct-sales methods, was taken in 1966 and has been continued since on an annual basis. Table 13 shows that, over the five-year period 1966-70, such direct sales increased by more than 16 p.c., rising from \$617,089,000 to \$718,254,000. Among the industries surveyed in 1970, the largest share of sales was accounted for by manufacturers and distributors of dairy products (22.8 p.c.); newspapers and magazines (18.7 p.c.); and cosmetics (10.2 p.c.). Businesses in these three industries were responsible for *more than half* of all direct sales reported. The

greatest growth, occurred primarily in the following areas: direct sales of electrical appliances rose 55.9 p.c.; clothing, 51.5 p.c.; cosmetics, 46.3 p.c.; and kitchenware and utensils, 44.3 p.c.

### 13.—Direct Selling by Manufacturers and Specialist Agencies, 1966-70

<sup>1</sup> Includes leather goods, jewellery and silverware, aluminum products, textiles, boats, other foods and beverages, stamps, coins, personal stationery, etc.

The channels of distribution employed by direct sellers in 1970 were very similar to those utilized in earlier years. As shown in Table 14, door-to-door sales in that year accounted for 72 p.c. of total sales, mail-order requests (excluding the mail-order business of Canadian department stores) amounted to 19 p.c., and sales from manufacturers' premises were 6 p.c.; the remaining 3 p.c. was sold by various other methods of contacting the customer.

<sup>3</sup> See footnote to Table 13.

**Campus Book Stores.**—As a supplement to its current retail trade series, Statistics Canada initiated, in 1969, a survey of book stores located on the campuses of universities and other post-secondary educational institutions. The pilot study covered the academic years 1966-67 and 1967-68, and subsequent surveys have produced a full range of data relating to the 1968-69 and 1969-70 years. Table 15 provides summary data on the sales of campus book stores for the four years.

**15.—Retail Sales in Campus Book Stores, Academic Years Ended 1967-70**

**Shopping Centres.**—One of the most interesting aspects of Canadian marketing during the past decade has been the continuing growth of shopping centres as a vital tool in the movement of goods and services from supplier to end-user. As shown in Table 16, sales in retail stores located in shopping centres increased by 84.1 p.c. between 1966 and 1970—nearly four times the rate of growth of total retail sales. The service trades operating within a shopping centre environment have also prospered, as indicated by the 45.7-p.c. increase in their total receipts from 1967 to 1970 (1966 data are not available).

The major retail kinds of business in shopping centres during 1966-70 continued to be grocery and combination stores, which accounted for 33.9 p.c. of retail sales, and department stores which accounted for 31.4 p.c. of the total. However, at their present rate of increase, department stores (+21.7 p.c. cumulative) will have overtaken grocery and combination stores (+13.9 p.c. cumulative) within the following two years, i.e., by the end of 1972. Restaurants continued to be the mainstay of service trades in shopping centres, accounting for 46.1 p.c. of total service receipts in 1970 compared with 45.9 p.c. in 1967. Dry cleaning and laundry locations, together with movie theatres and beauty salons, accounted for another 32.2 p.c. of 1970 service receipts in shopping centres.

Shoppers at Fairview Mall, North York, Ont., move easily with their carts or baby carriages from the lower to the upper level. North York, spreading north of the city of Toronto, is one of the fastest growing municipalities in Canada. It covers 70 sq. miles and is home to more than half a million people, whose needs for goods and services have resulted in a tremendous expansion of commerce and industry in the area.

Table 17 provides a breakdown of shopping centre stores and sales during 1970, by size of shopping centre and type of outlet. Although far more stores (both retail and service) are located in the small "neighbourhood" shopping centre than in any other, in terms of sales the large "regional" type of shopping centre has become the dominant force in this sector of the economy. Shopping centres with more than 30 stores in 1970 accounted for 40.4 p.c. of retail sales and 36.3 p.c. of service receipts among the three types of shopping centres. Department stores, in particular, are heavily concentrated in these larger centres, as shown by the fact that nearly 58 p.c. of department store sales take place in shopping centres.

## Wholesale Trade

The sales of wholesale merchants,\* as measured by a monthly reporting panel of such establishments, have increased consistently over the past several years. In 1970, they reached a new high of \$23,048,000,000, some 2.5 p.c. above the \$22,475,000,000 recorded during the previous year. Consumer goods wholesalers experienced a 7.2-p.c. increase in sales, compared with a 2.1-p.c. decline for wholesalers of industrial goods. The best results were recorded by wholesalers of grain, drugs and drug sundries, and scrap metal; the poorest by wholesalers of farm machinery, coal and coke, and footwear.

Table 18 shows the annual sales of wholesale merchants in 24 kind-of-business groupings and two residual categories during the period 1966-70. These data reflect changes in the wholesale trade series resulting from their adjustment to the 1966 Census bench-mark. Further information is given in *Wholesale Trade, 1966 Establishments* (Catalogue No. 97-627) and *Wholesale Trade, 1961-1970* (Catalogue No. 63-521).

18.—Sales of Wholesale Merchants, by Kind of Business, 1966-70

In addition to the monthly survey of wholesale merchants, two *annual* surveys of wholesale trade are undertaken by Statistics Canada at the commodity level—farm implements and equipment, and construction machinery and equipment. (It should be noted

\* Excludes manufacturers' sales branches, agents and brokers, primary product dealers and petroleum bulk plants and distributors. However, these types of wholesalers are covered in the wholesale trade census.

that estimates of farm implement and equipment sales are also published monthly, in aggregate form, based on the data reported by a panel of major-line companies.)

*Farm Implements and Equipment.*—Sales of farm implements and equipment (valued at wholesale prices) declined in 1970 for the third consecutive year. The sales total of \$278,981,000 was 19.0 p.c. lower than the comparable 1969 figure of \$344,309,000. Although the largest declines were experienced in British Columbia, every province and every commodity group suffered to some extent from the general "malaise" which affected sales of farm implements and equipment during 1970. Table 19 gives data on sales for 1966-70; sales of repair parts, not shown, were \$65,032,000 in 1970, 1.1 p.c. lower than the record \$65,751,000 reached in the previous year.

### 19.—Sales of Farm Implements and Equipment, by Province and by Major Group, 1966-70

NOTE.—Data are based on a commodity survey and therefore exclude sales of repair parts and other products and receipts from secondary activities, including repairs, carried out by respondents. The figures are not comparable with those given in Table 18.

*Construction Machinery and Equipment.*—This survey, which was first undertaken for the year 1967 and since repeated for 1969 and 1970, was designed to measure the sales of Canadian distributors and direct sales of manufacturers to end-users in the construction machinery and equipment field at actual final selling price and to assess the revenue derived from rentals. As shown in Table 20, total sales and rental revenue amounted to \$712,935,916, almost 80 p.c. of which was realized through the sale of new machinery and equipment. As in 1969, the survey produced additional information on the disposal of new construction machinery and equipment to end-users through such arrangements as first rental, demonstration or loan; the value of such machinery and equipment reached \$63,245,403 in 1970.

## 20.—Sales and Rentals of Construction Machinery and Equipment, by Major Commodity Group, 1970

### Service Trades

**Hotels.**—In addition to its annual hotel survey (Catalogue No. 63-204), Statistics Canada also reports semi-annually on the trend of hotel receipts in Canada, based on results obtained from a panel of hotels having 50 or more rooms. Table 21 shows that the receipts of such hotels increased by more than 28 p.c. during the 1966-70 period. The best results were experienced in Alberta and British Columbia and the poorest in Newfoundland and Prince Edward Island (combined) and in Saskatchewan. On a year-to-year basis, the greatest rise took place between 1966 and 1967, as Canada's Centennial-year celebrations produced a significant volume of hotel business. The let-down from 1967 to 1968 was felt most acutely in Quebec, which had shown the greatest increase in the previous year. From 1968 to 1969, hotel receipts in most provinces (except New Brunswick and Saskatchewan) increased at a faster rate than in the previous year. The results for 1969-70 showed less consistency than in earlier years, although Alberta, for the third time in succession, registered a larger increase than any other province. In contrast, hotel receipts in Saskatchewan have been trending downward, with successively smaller rates of growth each year from 1966 onward.

**21.—Percentage Change in Hotel Receipts, by Province, 1966-70**

<sup>1</sup> Includes the Yukon and Northwest Territories.

**Restaurants.**—The same forces that shaped hotel business during recent years were also evident in another large area of the service trades—restaurants and other eating places. It was these forces that produced the largest year-over-year increase in Quebec between 1966 and 1967, and that resulted in the largest decline in the same province between 1967 and 1968. As indicated in Table 22, restaurant receipts rose by more than \$140,000,000 (13.0 p.c.) over the 1966-70 period. The largest percentage growths took place in Alberta (32.2 p.c.), Nova Scotia (18.3 p.c.) and New Brunswick (17.4 p.c.). At the same time, three provinces registered absolute declines, led by Saskatchewan with a decrease of 16.3 p.c.

**22.—Restaurant Receipts, by Province, 1966-70**

**Motion Picture Theatres.**—In 1969 (latest data available at time of writing), the receipts of motion picture theatres, both regular and drive-in, reached their highest level ever. The total receipts of \$118,020,089 were 3.8 p.c. higher than in 1968 and the amount of amusement taxes collected rose to \$8,518,554, up 3.9 p.c. over the previous year. The increase in revenues was not evenly split; drive-in theatre receipts grew at a somewhat faster rate (+6.8 p.c.) than those of regular motion picture theatres (+3.3 p.c.). In contrast to the revenue and tax increases, the number of admissions for all types of theatres declined in 1969 for the fifth successive year, dropping 7.2 p.c. to 90,226,070. Unlike previous years, however, both regular and drive-in theatres lost customers during 1969—more than 6,000,000 in regular theatres alone and nearly 7,000,000 in all.

## 23.—Summary Statistics of Motion Picture Theatre Operations, 1968 and 1969

Item	1968			1969

**Film Exchanges.**—During 1969 (latest data available at time of writing), films were distributed by 52 companies through 117 offices located across Canada. These exchanges had total receipts of \$62,809,607 compared with \$64,653,218 in 1968, a decrease of 2.9 p.c., and paid \$5,254,423 in salaries and wages to 846 employees. (The activities of the National Film Board of Canada are not included here; they are covered in the Board's Annual Report, available from Information Canada, Ottawa.)

Receipts from the rental of films declined by \$2,398,273 during 1969, 3.7 p.c. below the previous year's high of \$64,186,740. Revenue derived from rentals for theatrical use amounted to \$41,014,356, for television use \$18,942,755 and for other (non-theatrical) use \$1,831,356. In addition, \$24,370 was derived from the sale of advertising and \$996,770 from other sources. New films released for theatrical bookings numbered 860, of which 669 were feature films, 97 cartoons, 62 newsreels and 32 other short subjects. Of the 669 feature films, 253 originated in the United States, 165 in Britain, 98 in Italy, 34 in France, 10 in Canada and 109 in other countries.

**Motion Picture Production.**—In 1970, there were 112 private (non-government) firms engaged principally in the production and printing of motion picture films and filmstrips for industry, government, education and entertainment purposes. These firms employed 1,345 persons, paid \$8,696,861 in salaries and wages, and had a gross revenue of \$34,061,638, an increase of 26.8 p.c. over 1969. Excluded from these data are television stations and three private firms engaged only partially in motion picture production; the latter produced 21 films, including eight television commercials, 12 non-theatrical motion pictures and one sound filmstrip.

<sup>1</sup> Excludes proprietors of unincorporated businesses.

Table 26 shows the motion picture production records of both private industry and government agencies during 1969 and 1970. Of the 4,968 films produced in Canada in 1970, 4,893 were in the English or French languages. During that year, despite the entry of 23 new firms and greatly increased revenues, Canadian motion picture production fell significantly below the 1969 level of activity; production by private firms declined 7.5 p.c. and by government agencies, 35.8 p.c. In total, private and government film producers printed 1,157,000 ft. of 8mm film, 32,013,895 ft. of 16mm film and 3,268,769 ft. of 35mm film in black and white; and 2,387,800 ft. of 8mm film, 60,004,604 ft. of 16mm film and 14,473,463 ft. of 35mm film in colour. Included in these figures were 26 sound motion pictures of five minutes or longer duration made for other than Canadian sponsors.

Video-tape firms were included for the first time in the 1970 survey of motion picture production. There were seven firms engaged principally in the production and printing of video tapes, with revenues for the year of \$3,406,158. These firms produced 1,853 tapes, of which 1,481 (79.9 p.c.) were television commercials.

**Power Laundries and Dry Cleaning and Dyeing Plants.**—In 1969 (latest data available at time of writing), the combined receipts of laundries and dry cleaning and dyeing plants increased by 2.0 p.c. over the previous year's level, reaching a new high of \$275,979,042. Power laundries reported revenues of \$111,309,589, 2.4 p.c. higher than in 1968, and dry cleaning and dyeing plants reported \$164,669,453, up 1.7 p.c. Salaries and wages paid by these firms reached a record \$127,772,882, an increase of 2.5 p.c. over the previous year, and the cost of materials and supplies used in their operations amounted to \$26,923,886, 2.2 p.c. more than in 1968. The upward trends reflected in these statistics provide further evidence of the increasingly important role that such "personal service" trades have assumed in the economic life of the nation.

<sup>1</sup> The 1969 survey of power laundries and dry cleaning and dyeing plants utilized a *sampling* approach; as a result, some of the information presented in earlier years was not available for 1969. <sup>2</sup> Based on a percentage distribution of total receipts. <sup>3</sup> Includes the Yukon and Northwest Territories.

**Advertising Agencies.**—Billings of advertising agencies rose dramatically during 1969 (latest data available at time of writing) to a new high of \$456,142,810, an increase of 7.0 p.c. over 1968. Advertising billings alone increased to \$450,332,349, up 6.8 p.c., while billings for market surveys, research and other fees jumped more than 34.0 p.c. As a result, gross revenues during 1969 rose by nearly 9.0 p.c. to \$78,874,175 and net revenues, at \$9,388,551, were almost double those recorded in 1968.

## Credit Statistics

**Sales Financing.**—During 1970, two important changes affecting both coverage and concept were made in the annual survey of sales financing: first, coverage was extended to include the sales financing (comprising mostly "other consumer goods" financing) of consumer loan companies, which increased the value of paper purchased during the year by \$140,000,000 and year-end balance outstanding by \$100,000,000; secondly, the financing of new passenger vehicles, the use of which is essentially of a commercial nature, was transferred from the "consumer goods" sector to the "commercial and industrial goods" sector (see Table 31). As a result of these changes, the comparability of 1970 data with those of earlier years has been seriously affected.

Although total balances outstanding of \$2,249,000,000 were reported on the books of sales financing companies at year-end—indicating a 3.1-p.c. increase over the previous year's record level of \$2,180,000,000—business activity in general during 1970 was not as brisk as in 1969. If the 1969 data were re-calculated on the "new" basis outlined above, the year-to-year comparison would actually result in a *decline* of 4.9 p.c. The only series that maintained an upward trend was the financing of used commercial vehicles, which rose 9.0 p.c. from \$75,000,000 in 1969 to \$82,000,000 in 1970. The lower volume of sales financing is most vividly depicted in the data on paper purchased, which fell 6.8 p.c. between 1969 and 1970 despite the infusion of instalment paper purchases of consumer loan companies.

**Consumer Credit.**—Although the total volume of credit extended to consumers by retail stores and selected financial institutions has grown progressively from the early 1950s to a record level of \$11,525,000,000 in 1970, the annual rates of increase have shown a tendency to decline during periods of credit restraint and weakness in buyer demand. During the 1961-69 period, the annual rate of increase in balances outstanding averaged 12.5 p.c. In 1970, however, balances increased by only 5.1 p.c.—the smallest since 1957—reflecting not only a reduced rate of credit expansion but also a statistical adjustment in the treatment of passenger cars used for commercial purposes, i.e., taxi fleets, auto rental fleets, etc. The effect of the latter change was to transfer approximately \$182,000,000 into "non-consumer" financing.

The growth of consumer credit has not been entirely consistent, particularly when viewed from the position of the credit-holder. The chartered banks have been by far the most active financial institutions engaged in this sphere of financing; consequently, their share of consumer credit rose from 23.8 p.c. in 1961 to 40.5 p.c. in 1970. In contrast, sales finance and consumer loan companies accounted for 31.3 p.c. of consumer credit (balances outstanding) in 1961 and 24.7 p.c. in 1970. The share of consumer credit held by retail stores also declined markedly during this period, falling from 24.9 p.c. to 13.5 p.c. It should be noted that the figures in Table 32 are exclusive of various forms of service and personal credit on which no detailed information is available.

**Retail Credit.**—This section permits a closer examination of recent trends in the "retail credit" component of consumer credit. Retail credit is defined as the value of accounts outstanding on the books of Canadian retailers, including department stores and their "captive" acceptance companies, adjusted to exclude non-consumer credit accounts.

During 1966-70, total retail credit outstanding rose by 14.6 p.c.—somewhat less than the 22.8-p.c. increase in retail sales over the same period. As noted in the preceding section, the proportion of consumer credit accounted for by retail stores has fallen significantly during the past few years—standing at 13.5 p.c. at the end of 1970. Much of this decline can be explained by the 12.0-p.c. drop in credit advanced by stores in the furniture, appliance and home furnishings group. However, as shown in Table 33, a vigorous growth in credit outstanding was experienced by fuel dealers, "all other" automotive businesses, men's clothing stores, general merchandise stores and general stores. Department stores continued to dominate the retail credit field and even improved slightly on their share of this market—from 45.1 p.c. in 1966 to 46.4 p.c. in 1970.

## Section 2.—The Marketing of Agricultural Products\*

### Subsection 1.—The Grain Trade, 1969-70 and 1970-71

#### The 1969-70 Crop Year

Estimated domestic supplies of wheat, oats, barley, rye, flaxseed and rapeseed totalled 2,710,000,000 bu. in the crop year 1969-70, 19 p.c. above the 1968-69 total of 2,285,300,000 bu. Marketings of these grains in the Prairie Provinces amounted to 660,700,000 bu., a 13-p.c. increase over the 1968-69 level of 583,200,000 bu. and a 4-p.c. increase over the ten-year (1958-59-1967-68) average of 635,500,000 bu. Marketings of wheat during the 1969-70 crop year, at 413,300,000 bu., were down 2 p.c. and accounted for 63 p.c. of the total deliveries. Marketings of the other major grains (with totals for 1968-69 and ten-year averages, respectively, in brackets) in millions of bushels were: oats, 20.9 (41.6, 43.0); barley, 168.4 (81.8, 90.7); rye, 7.6 (3.8, 7.3); flaxseed, 22.1 (15.3, 16.1); and rapeseed, 28.5 (17.6, 11.1).

As in the preceding crop year, an initial quota of 100 units was established effective Aug. 1, each unit being the equivalent of 4 bu. of wheat, or 10 bu. of oats, or 6 bu. of barley, or 6 bu. of rye; the producer could deliver any combination of these grains amounting to 100 units. The Board also announced that the initial quota would be followed by general quotas at individual points as space became available and the first of these became effective Dec. 17, 1969. The quotas were based on the producers' specified acreage which consisted of acreage seeded to wheat (including Durum), oats, barley and rye, plus acreage summer-fallowed or cultivated and producing eligible forage crops.

Stocks of grain in commercial positions were at a record level at the beginning of the 1969-70 crop year and remained relatively high throughout the year, so that the movement of grain into country elevators was directly related to the disappearance in export and domestic channels. Large farm supplies, particularly of wheat, resulted in substantial volumes being marketed at each quota level. In addition, it was necessary to create additional space in the elevator system to permit an efficient movement of grain required to meet market demands. For these reasons, the general quota advanced slowly throughout the crop year.

An increased demand for export barley and Durum wheat developed in the fall of 1969. To be assured of supplies to meet commitments, supplementary quotas were authorized for these two grains and farm deliveries under the supplementary quotas were relatively large. Also, farm deliveries of oilseeds under the seeded acreage quotas were larger than marketings of a year earlier.

On Feb. 27, 1970, the Board announced that it would equalize the general quota at the 4-bu. level by the end of the crop year. Special delivery permits were granted to those producers unable, through no fault of their own, to deliver the 4-bu. quota.

In addition to the unit and specified acreage quotas, other quotas were authorized on specific grains and oilseeds throughout the 1969-70 crop year, as summarized in the following paragraphs.

*Durum Wheat.*—Durum wheat was included in the specified acreage in the 1969-70 crop year but, in order to meet overseas and domestic requirements prior to the closing of navigation, a supplementary quota was authorized on high-grade Durum of the larger of 5 bu. per seeded acre or 250 bu. for the period Sept. 2 to Nov. 28, 1969, extended on Nov. 7 to July 31, 1970. On Jan. 9, 1970, a supplementary quota on high-grade Durum wheat of an additional 3 bu. per seeded acre was authorized for the period Jan. 9 to Mar. 31, 1970, extended on Feb. 27 to July 31, 1970.

*Soft White Spring Wheat.*—A supplementary quota of 8 bu. per acre seeded to Soft White Spring wheat was authorized on Dec. 16, 1969; on Feb. 20, 1970, this quota was increased to 16 bu. per seeded acre.

\* Prepared (November 1971) in the Agriculture Division, Statistics Canada.

*Oats.*—A supplementary delivery quota of one carlot of oats suitable for milling or other purposes was authorized on Dec. 3, 1969. On Jan. 12, 1970, a revision was implemented and only oats suitable for the manufacture of rolled oats and/or oat groats were authorized until June 30, 1970.

*Barley.*—A supplementary quota of 3 bu. per seeded acre or 250 bu., whichever was the greater, was authorized for the period Sept. 30 to Nov. 28, 1969. It was reinstated on Feb. 27, 1970 for the remainder of the crop year and then, on Apr. 17, was increased to 6 bu. per seeded acre. Effective May 27, a further supplementary quota of the larger of 10 bu. per seeded acre or 1,000 bu., was authorized for all delivery points in Manitoba and Saskatchewan.

Effective Aug. 1, 1969, producers could deliver, under special permit, one carlot of barley suitable for malting, pot or pearling, provided a sample had been submitted to and accepted by a maltster or a shipper on a premium basis. On Dec. 5, 1969, provision was made for producers to deliver a second carlot of barley of the Olli variety and this privilege was further extended on Apr. 9, 1970 to any additional carlots of Olli barley. On Mar. 3, the provision to allow barley deliveries in excess of established quotas was extended to a second carlot of 2-Row barley and on May 14 this privilege was extended to any additional carlots of 2-Row barley.

*Rye.*—Rye acreage was again contained in the specified acreage and thus deliveries were subject to the general quota but on Dec. 10, 1969, a supplementary quota of 3 bu. per seeded acre was authorized. This quota was increased to 8 bu. per acre on Feb. 4, 1970 and to 13 bu. per acre on May 15, 1970; it expired on June 30, 1970.

*Flaxseed.*—Effective Aug. 1, 1969, a delivery quota of 5 bu. per seeded acre or 250 bu., whichever was the greater, was established for flaxseed. As in previous years, the producer could deliver flaxseed within the existing quota to any delivery point at which space was available. On Nov. 20, 1969, the quota was increased to the larger of 8 bu. per seeded acre or 400 bu. and on Feb. 5th, 1970 it was further increased to 11 bu. per acre. On Mar. 13, 1970, the delivery quota was declared open for the remainder of the 1969-70 crop year.

*Rapeseed.*—Effective Aug. 1, 1969, a quota of 5 bu. per seeded acre or 250 bu., whichever was the larger, was authorized for rapeseed. As in previous years, producers could deliver rapeseed within the existing quota to any delivery point at which space was available. On Oct. 14, 1969, the quota was increased to the larger of 8 bu. per acre or 400 bu., and on Jan. 16, 1970, to 13 bu. per seeded acre. On Mar. 13, 1970, the quota was declared open at all delivery points for the remainder of the 1969-70 crop year.

*Wheat.\**—Domestic supplies of wheat in 1969-70 were at an all-time high of 1,536,100,000 bu., 17 p.c. above the 1968-69 previous record total of 1,315,400,000 bu. The 1969 production of wheat was 684,300,000 bu. compared with 649,800,000 bu. in 1968 and carryover stocks were 851,800,000 bu. compared with 665,500,000 bu. Exports of wheat and flour in terms of wheat during the 1969-70 crop year, at 346,500,000 bu., were 13 p.c. above the 305,800,000 bu. exported in 1968-69 and 11 p.c. more than the long-term average of 312,600,000 bu. but were 14 p.c. less than the ten-year average of 404,500,000 bu.

During the crop year 1969-70, marketing of western Canadian wheat was again conducted by the Canadian Wheat Board on a one-year Pool basis, the initial payment being \$1.50 per bu. basis No. 1 Northern in store Thunder Bay or Vancouver. On June 17, 1971, the Board announced that the final payment to Canadian wheat producers for deliveries during the 1969-70 crop year totalled \$31,367,473; the final payment averaged 7.66 cents per bu.

The International Grains Arrangement (IGA) became effective on July 1, 1968 for a three-year period. It consists of two legal instruments—a Wheat Trade Convention and a Food Aid Convention. The International Wheat Council, established in London, England, by the International Wheat Agreement 1949, continues in being for the purpose

\* Data dealing with the operation of the International Grains Arrangement are from the 1969-70 Annual Report of the Canadian Wheat Board.

of administering the Wheat Trade Convention and providing service to the Food Aid Committee, the body that reviews contributions made under the Food Aid Convention.

Preparatory discussions were held during the latter part of the crop year to establish the required machinery for a possible re-negotiation of the International Grains Arrangement.

*The Wheat Trade Convention.*—During the 1969-70 crop year (July-June), the IGA had 34 importing and 10 exporting countries plus the European Economic Community (EEC and its six member states) participating in the Arrangement. The EEC, which regularly engages in both import and export activities, is listed simultaneously as an exporting country and as an importing country with all the rights and obligations deriving therefrom.

IGA member countries are involved, either as importers or exporters, in over 90 p.c. of the total world trade, commercial and non-commercial, of wheat and wheat flour. However, only commercial sales between members are explicitly subject to the terms of the Wheat Trade Convention. Commercial sales by member exporting countries to member importing countries in 1969-70 amounted to 707,000,000 bu., constituting 38.5 p.c. of total world trade in wheat and flour.

All member importing countries, under the terms of the Wheat Trade Convention, each year agree to purchase a stipulated percentage of their wheat imports from other member countries; the quantity obligated by all importers in 1969-70 averaged 73 p.c. As a matter of record, member importing countries, as a group, purchased 92 p.c. of their import requirements from other member countries in 1969-70. Only Lebanon, with an obligation to purchase 70 p.c., in fact purchased a lower percentage from other members of the Convention.

#### SUPPLY AND DISPOSITION OF CANADIAN WHEAT CROP YEARS ENDED JULY 31, 1960-70

The pricing provisions of the IGA were not adhered to by member countries during the 1969-70 crop year.

*The Food Aid Convention.*—Eleven countries plus the EEC and its member states were members of the Food Aid Convention in its second year of operation. Over-all commitments, including cash contributions, by members in 1969-70 exceeded the total obligation of approximately 4,259,000 tons. Canada's contribution was 25,033 tons—900,000 bu. in excess of its obligation of 495,000 metric tons (18,200,000 bu.).

*Price Guarantee for Domestic Sales.*—On Aug. 1, 1969, the Minister of Industry, Trade and Commerce and the Minister of Agriculture issued a joint statement on the Canadian grain situation which included the following announcement relative to the domestic price of Canadian wheat. "It has not been possible for Canada, because of actions by other exporters, to maintain the minimum International Grains Arrangement price in export markets. But the government had decided to guarantee producers that the price of wheat sold on markets where it has control will not fall below the minimum set under the International Grains Arrangement. This now amounts to \$1.95½ per bu., basis No. 1 Northern. This means that wheat sold for most users in Canada other than for livestock and poultry feeding will bring the appropriate International Grains Arrangement price. This move will guarantee western farmers the International Grains Arrangement minimum on an important portion of their wheat. At the same time there is no justification for an increase in the price of bread or other wheat products. The milling industry, for example, has until only very recently been paying the International Grains Arrangement minimum price or higher."

**Grain Marketings.**—The 1969-70 exports of bulk wheat, at 317,700,000 bu., were higher than the preceding year's total of 280,500,000 bu. but lower than the recent ten-year average of 366,400,000 bu.

During the 1969-70 crop year, the People's Republic of China, with purchases of 65,100,000 bu., remained Canada's principal wheat customer; Britain was second with imports of 52,700,000 bu. and the Soviet Union third with purchases of 47,300,000 bu. Sales of Canadian wheat to Japan, at 39,000,000 bu., declined somewhat during the 1969-70 crop year and moved that country to fourth position. Other leading markets with quantities in millions of bushels (1968-69 figures in brackets) were as follows: India, 16.5 (15.3); Italy, 12.1 (15.2); Federal Republic of Germany, 9.7 (12.8); Belgium and Luxembourg, 9.0 (7.5); the Netherlands, 7.1 (5.8); Peru, 6.2 (nil); and Cuba, 5.2 (1.7).

The export movement of Canadian wheat flour during the 1969-70 crop year amounted to 11,800,000 cwt. (27,000,000 bu. of wheat equivalent), some 10 p.c. above the 1968-69 total of 24,600,000 bu. Cuba was Canada's major customer for wheat flour, taking 6,000,000 cwt. or 13,800,000 bu. of wheat equivalent and accounting for 51 p.c. of the crop-year total. Britain, with imports equivalent to some 2,000,000 bu., accounted for 7 p.c. of the crop-year total, and Ceylon and Burma imported 1,300,000 bu. and 1,200,000 bu., respectively.

Marketings of western Canadian oats and barley were again carried on through compulsory crop-year Pools administered by the Canadian Wheat Board. The initial payment for oats, basis No. 2 C.W. in store Thunder Bay, during the 1969-70 crop year, at 60 cents per bu., was 5 cents below the 1968-69 initial payment. The initial payment for barley, basis No. 3 C.W. Six-Row in store Thunder Bay, at 91 cents per bu., was 15 cents lower than in the previous year. No interim payments were made on either grain during the crop year. On Feb. 4, 1971, final payments on the 1969-70 oat and barley Pools were announced.

Combined exports of oats, seed oats, barley, rye, flaxseed and rapeseed (including customs exports of oatmeal and rolled oats, and malt in terms of grain equivalent) amounted to 138,100,000 bu. during the crop year 1969-70. This figure was sharply above both the comparable 1968-69 level of 61,100,000 bu. and the ten-year (1958-59-1967-68) average of 84,200,000 bu.

Exports of Canadian oats in bulk totalled 4,800,000 bu. during 1969-70 compared with 2,300,000 bu. shipped during the previous year. The Federal Republic of Germany was the principal market for this grain with purchases of 2,600,000 bu., while the United States accounted for a further 1,000,000 bu. Other shipments went to the Netherlands, 500,000 bu.; Britain, 400,000 bu.; Belgium and Luxembourg, 200,000 bu.; and Syria and Switzerland, 100,000 bu. each. In addition, exports of Canadian oatmeal and rolled oats amounted to the equivalent of 61,000 bu. in 1969-70 against 79,000 bu. the year before.

Barley exports, at 82,700,000 bu., were at their highest level since the 1953-54 crop year (90,000,000 bu.) and represented the third largest clearances on record. Britain remained the major market for this grain with imports of 19,600,000 bu., approximately double the 1968-69 figure. Japan was second, purchases by that country having risen from less than 1,000,000 bu. in 1968-69 to 16,900,000 bu. in 1969-70. Italy, not recorded as a market during the 1968-69 crop year, was the destination for 12,600,000 bu. and the United States accounted for a further 10,300,000 bu. Shipments to other major customers were as follows (with totals for the previous year in brackets) in millions of bushels: Federal Republic of Germany, 6.3 (nil); Israel, 5.3 (1.3); Poland, 4.8 (nil); Colombia, 1.8 (nil); New Zealand, 1.2 (nil); and the Netherlands, 1.0 (nil).

In addition to the exports of Canadian barley as grain, shipments of malt in 1969-70 were the equivalent of 5,600,000 bu., a slight increase over the 1968-69 figure of 5,200,000 bu. Exports of malt were shipped to 22 different destinations, the major markets being Japan, 1,400,000 bu.; the United States, 1,300,000 bu.; Venezuela, 600,000 bu.; and the Philippines, 500,000 bu.

Exports of Canadian rye during the 1969-70 crop year, at 3,800,000 bu., were the lowest since 1960-61 when 2,600,000 bu. were recorded. Principal markets for this grain in 1969-70 were Japan, 2,000,000 bu.; the United States, 800,000 bu.; Britain, 500,000 bu.; the Netherlands, 300,000 bu.; and Denmark, 200,000 bu.

During 1969-70, clearances of Canadian flaxseed moving overseas amounted to 18,600,000 bu., 39 p.c. above the 13,400,000 bu. of the previous year. The leading market was Japan which imported 5,700,000 bu. followed by the Netherlands and Britain with 4,100,000 bu. and 2,900,000 bu., respectively. Relatively smaller shipments of Canadian flaxseed went to some 15 other overseas destinations. Exports of linseed oil were equivalent to about 1,100,000 bu. of flaxseed, most of which went to Britain.

In the 1969-70 crop year, trade in rapeseed amounted to 22,200,000 bu., an all-time high 55 p.c. above the 14,300,000 bu. of the previous year. Japan continued to be the major market for this oilseed with purchases of 14,400,000 bu., an increase of some 33 p.c. over 1968-69. Clearances to the Netherlands at 2,800,000 bu., and to the Federal Republic of Germany at 1,000,000 bu., were well in excess of 1968-69 exports to these countries. Mustard seed exports, at 2,700,000 bu., were below the 1968-69 level of 3,100,000 bu., the leading markets in 1969-70 for this product being the United States, Belgium and Luxembourg, Japan, the Netherlands, and the Federal Republic of Germany.

### The 1970-71 Crop Year

The 1970-71 crop year opened with carryover stocks of the six major grains (wheat, oats, barley, rye, flaxseed and rapeseed) at 1,370,400,000 bu. Stocks of wheat at Aug. 1, 1970 amounted to 1,008,700,000 bu., significantly higher than the 851,800,000 bu. held in storage a year earlier. Aug. 1, 1970 stocks of the other major grains in millions of bushels (1969 figures in brackets) were: oats, 141.3 (128.7); barley, 200.1 (199.4); rye, 10.6 (8.7); flaxseed, 6.0 (4.9); and rapeseed, 3.6 (5.1).

Domestic production of the six major grains amounted to 1,258,600,000 bu. in 1970-71. Wheat decreased from 684,300,000 bu. in 1969-70 to 331,500,000 bu. in 1970-71, resulting in a total supply for the 1970-71 crop year of 1,340,200,000 bu. Oats declined from 371,400,000 bu. to 367,800,000 bu., for a supply of 509,200,000 bu. in 1970-71. An estimated 415,700,000 bu. of barley were produced which, combined with opening stocks, resulted in a supply for 1970-71 of 615,800,000 bu. Rye production rose to 22,400,000 bu. from 16,500,000 bu. in 1969-70, resulting in a supply for 1970-71 of 33,100,000 bu. Flaxseed and rapeseed production also increased to 48,900,000 bu. and 72,200,000 bu., respectively, the supplies amounting to 54,900,000 bu. and 75,800,000 bu., respectively.

Farmers' marketings of the six grains during the 1970-71 crop year amounted to 784,400,000 bu., an increase of 19 p.c. over the 1969-70 total of 660,700,000 bu. With the exception of wheat, each of the other five grains registered an increase in 1970-71 over 1969-70. Marketings of wheat at 383,900,000 bu. were down by 7 p.c. and accounted for 49 p.c. of all deliveries. Marketings of the other major grains in millions of bushels (1969-70 totals in brackets) were: oats, 57.9 (20.9); barley, 235.9 (168.4); rye, 11.7 (7.6); flaxseed, 33.6 (22.1); and rapeseed, 61.4 (28.5).

During 1970-71, Canada exported 704,900,000 bu. of the six major grains, including 24,700,000 bu. of wheat flour in terms of wheat equivalent. Export clearances of wheat rose to 409,400,000 bu., some 29 p.c. above the 1969-70 total of 317,700,000 bu. and nearly 11 p.c. more than the ten-year (1959-60-1968-69) average of 369,200,000 bu. Exports of oats at 13,100,000 bu. were sharply above the 1969-70 total of 4,800,000 bu. Barley exports rose to 172,300,000 bu. from the 1969-70 level of 82,700,000 bu. and rye exports also climbed to 8,900,000 bu. from 3,800,000 bu. Flaxseed and rapeseed exports both registered gains in 1970-71, rising to 21,200,000 bu. from 18,600,000 bu. and to 46,800,000 bu. from 22,200,000 bu., respectively.

Total domestic consumption of wheat in Canada declined to 155,600,000 bu. in 1970-71 from 180,900,000 bu. in 1969-70 due to a relatively sharp decrease in the estimated quantity fed which more than offset an increase in seed requirements. Domestic utilization of oats rose to 366,900,000 bu. from 353,500,000 bu., of barley to 293,200,000 bu. from 289,400,000

bu., and of rye to 11,800,000 bu. from 10,700,000 bu. Domestic disappearance of flaxseed declined from 7,900,000 bu. to 7,200,000 bu., while disappearance of rapeseed increased sharply from 12,600,000 bu. to 19,200,000 bu.

Stocks of wheat at the close of the crop year on July 31, 1971, stood at 749,500,000 bu., 26 p.c. below the closing stocks of the previous year. Year-end stocks of the other major grains were: oats, 128,900,000 bu.; barley, 143,000,000 bu.; rye, 12,400,000 bu.; flaxseed, 26,500,000 bu.; and rapeseed, 9,900,000 bu.

### Miscellaneous Grain Trade Statistics

**Grain Handled at Eastern Elevators.**—Total receipts of the six major grains at eastern elevators in the 1969-70 crop year amounted to 370,679,000 bu., 37 p.c. more than in the previous crop year. Shipments, amounting to 387,062,000 bu., were 57 p.c. above the 1968-69 level of 245,906,000 bu.

**Lake Shipments of Grain.**—The 1970 navigation season opened at the Canadian Lakehead on Apr. 8 and closed on Dec. 23. During the season, shipments of wheat, oats, barley, rye, flaxseed, rapeseed and mustard seed totalled 472,195,000 bu., an increase of 79 p.c. over the 263,921,000 bu. shipped during the 1969 navigation season which opened on Apr. 11 and closed on Dec. 23.

**Licensed Grain Storage.**—Total grain storage capacity in Canada, licensed under the provisions of the Canada Grain Act by the Canadian Grain Commission, amounted to 700,095,000 bu. at Dec. 1, 1969, compared with 700,349,000 bu. at the same date in 1968. Lower capacity in interior private and mill, Pacific Coast and lower St. Lawrence ports more than offset an increase in western country elevators. Table 37 gives the amount in storage at three dates during the years. On July 31, 1970, 73.6 p.c. of the licensed storage capacity was occupied as compared with 77.3 p.c. on the same date of 1969.

<sup>1</sup> Wheat, oats, barley, rye, flaxseed and rapeseed.

**Production and Exports of Wheat Flour.**—Production of wheat flour in the 1969-70 crop year amounted to 39,640,000 cwt. and wheat milled for flour totalled 90,557,000 bu.; both were above the corresponding totals for 1968-69. Of the wheat milled for flour, approximately 76,368,000 bu. were western Canadian spring wheat (other than Durum) and the remainder was made up of 8,305,000 bu. of Ontario winter wheat, 4,445,000 bu. of Durum wheat and 1,440,000 bu. of other types. Utilization of milling capacity, based on a daily operating potential of some 170,000 cwt., averaged 77.7 p.c. in 1969-70 compared with 73.9 p.c. in the previous year. Exports of wheat flour in 1969-70 amounted to 11,723,000 cwt. compared with 10,705,000 cwt. exported in 1968-69.

**38.—Wheat Milled for Flour, and Production and Exports of Wheat Flour, Five-Year Averages 1945-65 and Crop Years Ended July 31, 1966-70**

**Subsection 2.—Livestock Marketings\***

Marketings of all classes of livestock except hogs were reduced in 1970, and an absence of profitable export trade during most of the year left 3 p.c. more meat available for domestic use, largely attributable to a 10-p.c. increase in pork. However, despite reductions in the production of cattle, calves, sheep and lambs, the over-all increase in prices resulted in appreciable gains in the per head value in each of these classes.

Marketings of cattle through public stockyards, shipped direct to packing plants and on export, and to country points in another province, amounted to 3,242,938 head in 1970, down 2.6 p.c. from the previous year. Manitoba, with a 7-p.c. increase, was the only western province to show an appreciable advance in production. The sharpest decrease was in British Columbia which had 37.6 p.c. fewer marketings; Alberta dropped 4.7 p.c. and Saskatchewan 1.5 p.c. Ontario's production, despite a sharp increase in the live exports, dropped 5.5 p.c. but Quebec showed an increase of 25.6 p.c. Calf marketings followed the same trend, showing a decrease in output of 2.7 p.c. to 1,174,565 head. A feature of the calf market was the all-time high production in the Province of Quebec amounting to 438,130 head. The quality of beef cattle graded at inspected packing plants set a record in 1970, with 65.1 p.c. of the total gradings being choice and good carcasses. Prices were at the steadiest level on record, and the all-Canada average price for all cattle in 1970 was \$27.85, an increase of \$1.20 over the previous year. Choice and good veal and butcher calves showed the sharpest price advances of all slaughter classes of cattle and calves, the top grades of vealers averaging \$42.20, or \$2.10 above the previous year, and the top-quality heavy butchers averaging \$33.35, or \$3.65 higher than in 1969. Replacement cattle followed the price trends of top grades of the slaughter classes, with good feeder steers \$1.55 higher at \$32.75. Stock calves were nearly \$2 above the previous year.

Hog marketings in 1970 totalled 8,648,250, a number second only to the record set in 1944, and a 16-p.c. increase over 1969. The western provinces accounted for 70.9 p.c. of

\* More detailed information is available from Statistics Canada annual report *Livestock and Animal Products Statistics* (Catalogue No. 23-203) and the Canada Department of Agriculture publication *Livestock Market Review*. Statistics of livestock and poultry production and disappearance are given on pp. 561-564.

the year's increase in production with Manitoba reaching an all-time high. The average weight of hogs slaughtered in federally inspected packing plants showed an increase of 2 lb. per carcass at 165.4 lb. dressed. Heavier carcass weights continue to prevail since the introduction of the new hog carcass evaluation system. The average price paid for all hogs declined by \$5.10 per cwt. to \$30.10.

Sheep and lambs shipped to public stockyards, packing plants and on export, and shipments from country points in one province to those in another totalled 228,122 head, a reduction of 18.6 p.c. from 1969. This was the lowest total output through commercial channels and inspected slaughterings ever recorded. Quality remained high with 84 p.c. of the carcasses graded as choice and good, compared with 85 p.c. in 1969. The all-markets average for sheep and lambs combined was 50 cents above 1969 at \$27.90 per cwt.; in contrast the good lambs were up only 15 cents at \$30.60 compared with 1969.

### Section 3.—Co-operative Organizations\*

Canadian co-operative business volume declined in 1969 for the second consecutive year and for about the same reason—slumping grain exports. Total revenue of 2,373 local co-operatives came to \$2,092,100,000, 2 p.c. below the 1968 figure. The revenue of each of the four broad components of co-operative business was: farm product marketings, \$1,231,900,000, down 4 p.c.; sales of merchandise and supplies, \$727,200,000, up a modest 1 p.c.; revenue from services (trucking, cold storage, seed cleaning, etc.), \$65,700,000, down about \$400,000 or less than 1 p.c.; and miscellaneous income (rent, interest, dividends, etc.), \$16,100,000, up \$2,000,000 for a very substantial increase of 14 p.c.

Business co-operatives can be classified by their primary function into four main groups: marketing and purchasing (by far the largest group), service, fishermen's and whole-sale. The first three groups are known as "local" co-operatives since they deal directly with individual members; the wholesale co-operatives, as their name indicates, perform wholesaling functions for the locals. Revenues of the wholesale co-operatives are usually presented separately from those of the locals since their sales are mostly a duplication of the locals' sales. Assets of the locals at Dec. 31, 1969 amounted to \$1,250,000,000 and represented a gain of \$73,000,000 or 6 p.c. over the year, almost half of which was due to increases in Prairie grain inventories. The number of co-operatives declined in 1969, continuing a long-term trend of readjustment, also evident in many other sectors of the econ-

\* Prepared in the Economics Branch, Canada Department of Agriculture, Ottawa.

omy, whereby one large integrated unit serves an area formerly served by several smaller units. Membership in co-operatives at 1,690,000 was down slightly from the previous year.

Marketing and purchasing co-operatives experienced an over-all reduction in business volume during 1969 with a fall-off in farm product marketings outweighing modest increases in sales of supplies, service revenue and other income. As already stated, farm product marketings of \$1,231,900,000 were down 4 p.c. Poultry and egg marketings, with the exception of the Maritimes, were lower in all areas, particularly in Alberta. The closing of two large co-operative meat-packing plants caused a decline in livestock volume despite good gains in British Columbia, Alberta and Saskatchewan. Grain marketings, as mentioned above, slipped again due to the continued slackness in grain exports. Dairy marketings continued the steady upward trend of previous years with all provinces contributing to the increase, most impressively Nova Scotia and Quebec. Fruit and vegetable marketings moved ahead a modest 3 p.c., led by British Columbia and Nova Scotia. Maple products, fur and lumber marketings also registered gains over the previous year while honey, tobacco and wool marketings eased downward. Sales of supplies and merchandise rose to \$721,400,000 during 1969 with all but Saskatchewan, Quebec and the interprovincial co-operatives sharing in the increase. The dollar value of feed sales declined slightly even though the physical volume increased, reflecting the availability of large, low-priced supplies of Ontario grains in Central Canada. Fertilizer volume slumped badly during the year with a drop of \$8,000,000 or 14 p.c. Although sales rose in some provinces, the Prairies experienced a severe downturn due to low farm income in the depressed grain economy. Fertilizer prices were also depressed because of excess capacity in the fertilizer industry generally. Food and petroleum products continued their unspectacular but steady gains. Clothing and home furnishings and hardware sales recorded impressive advances for 1969 but building materials and machinery sales eased off, due mainly to the depressed conditions in the Prairie Provinces. The miscellaneous sales category fell sharply but this was mostly caused by a Quebec co-operative's disposal of its textbook selling business. Assets of the marketing and purchasing co-operatives rose by \$62,000,000 or 6 p.c. over the year, with all provinces except New Brunswick contributing to the increase. The number of marketing and purchasing co-operatives continued to decline but, with the exception of Manitoba, membership remained relatively stable. The Manitoba membership figure was revised downward because a large co-operative made a major updating of its membership records.

Despite a good year for most of the co-operatives in the services sector, over-all revenues and membership were lowered by the severe curtailment of co-operative medical insurance coverage in Ontario and British Columbia where it was superseded by new government medical care plans. Total business volume of the service and production co-operatives in 1969 came to \$63,979,000 and included service revenue of \$36,500,000, marketings of farm products and sales of supplies of \$25,500,000, and miscellaneous income of \$1,970,000, as compared with \$65,100,000, \$38,427,000, \$24,971,000 and \$1,727,000, respectively, in the preceding year. Membership declined to 293,000, a loss of 23,000 during the year. Assets of these co-operatives had grown to \$140,266,000 at the 1969 year-end, a gain of almost \$11,000,000 centred in British Columbia, Alberta and Quebec. Fishermen's co-operatives recorded an impressive 15-p.c. recovery from the rather depressed levels of 1968, led by the fishermen from British Columbia but also including those from Nova Scotia, Newfoundland, Manitoba, Quebec and New Brunswick. Total business volume for 79 fishing co-operatives representing 9,000 fishermen spread over all 10 provinces amounted to \$32,490,000 in 1969 and was made up of fish marketings \$27,400,000, fishing and other supply sales \$4,066,000, and service revenue and other income \$1,000,000. Assets were \$18,100,000, more than half of which were located in British Columbia.

Wholesale volume climbed \$40,000,000 or 7 p.c. in 1969 and featured a rather large gain of 13 p.c. in farm product marketings and a not unusual but steady gain in supply sales of 4 p.c. The rise in marketings received its greatest impetus from a continued upward surge in Quebec dairy volume due to progressive improvements in production efficiency at the farm level and further co-ordination and streamlining of marketing facilities. Whole-

sale livestock marketings were also well ahead for the year, particularly in Ontario where the co-operative share of stockyard volume is expanding. Fish marketings rose impressively, reflecting improved economic conditions in the fishing industry generally. Feed and fertilizer were the only supply categories that declined during the year; the former due to low prices, and the latter due to both low prices generally and depressed demand in the Prairie Provinces. All other supply categories registered gains, although their rate of increase was adversely affected by the economic sluggishness of the Prairie Provinces. To sum up, total revenue of the wholesales amounted to \$600,200,000 and consisted of supply sales \$376,900,000, and farm product marketings \$223,300,000. The largest supply sale categories were food \$115,100,000, feed \$77,900,000, and petroleum \$65,600,000. Livestock (\$95,200,000) and dairy products (\$63,800,000) accounted for the bulk of marketings. Assets of the eight wholesales and one wholesaler for the wholesales totalled \$222,700,000 at Dec. 31, 1969.

**PART II.—GOVERNMENT AIDS TO AND CONTROL OF DOMESTIC TRADE****Section 1.—Aids and Controls Affecting the Marketing of Farm Products****Subsection 1.—The Role of Government in the Grains Industry**

The history of the grains industry in Western Canada is a record of the inter-relationships of producers, transportation, grain handling, shipping and export companies, whether investor- or farmer-owned, and of the provincial and federal governments. The inputs made by the Federal Government in the interest of the industry have ranged over a variety of areas. In the first instance, the Federal Government's contribution was by way of encouragement and assistance to railway construction and then by pursuit of a vigorous immigration policy to settle the western farming area. The Canada Department of Agriculture followed up with technical assistance in plant-breeding and production methods to improve yields of high-quality grains for which there was a ready export market. Simultaneously, the Federal Government was called upon to exercise a regulatory function within the industry which involved the establishment and definition of grades, supervision of weighing and dockage and equitable access to transportation. This regulatory function began before Confederation but was considerably advanced with federal legislation embodied in the Manitoba Grain Act of 1900 and the Canada Grain Act of 1912. Then, the First World War precipitated the Federal Government into a marketing role, marked by the formation of the Board of Grain Supervisors and its successor, the first Canadian Wheat Board.

In the decade of the 1920s, the marketing function reverted to the industry, during which time the Alberta, Saskatchewan and Manitoba Wheat Pools were formed to continue on a voluntary basis the pooling method employed on a compulsory basis by the Canadian Wheat Board.

Commencing in 1930, the Federal Government intervened once more to relieve the pools from the financial impact of the depression, and operated with federal financial support the Central Selling Agency of the pools as a price stabilization operation. In 1933, the Federal Government took the initiative in negotiating the first international wheat agreement in the hope of effecting price stability. In 1935, a new Canadian Wheat Board was created, which provided a floor price and accepted deliveries on a voluntary basis. Then, during the Second World War, the Wheat Board was given control over all wheat deliveries and, after the War, those of oats and barley as well. Also in the early postwar years, the International Wheat Agreement was re-negotiated and operated on a more continuing basis.

Canadian Cabinet Ministers to whom the Canadian Wheat Board has reported have assumed the primary responsibility for government grain policy, whether assisted by a Committee of the Cabinet or otherwise. The Minister traditionally has been the Minister of Trade and Commerce, but in more recent years the tendency has developed to assign the Wheat Board to a Minister whose background and experience are identified with the wheat growing area. In 1969, for the first time, a Minister was assigned the responsibility of the Canadian Wheat Board on a full-time basis. For a year he exercised this responsibility for grain policy exclusively, until he was also assigned an additional portfolio.

### Grains Group

In 1970, the Minister responsible for the Canadian Wheat Board organized the Grains Group, a body of grain policy advisers with specialties in production, marketing and transportation drawn from the federal departments and private industry. Under the Minister's direction, the Grains Group addressed itself to the re-examination of existing policies and their revision in order to expand markets and to shift production emphasis from crops in slow demand to others with better marketing prospects. Independently of the Grains Group, the Canadian Wheat Board simultaneously reviewed its own marketing policies. At that time, wheat stocks in Canada had risen far beyond market requirements, partly because government assistance had been favouring wheat at the expense of more marketable grains. The Government's concern concentrated on three broad areas of improvement within the grain industry: (1) aggressive development of new grain markets; (2) removal of extreme downward fluctuations in grain receipts; and (3) the adaptation of existing institutions and policies to provide producers with the best information on market demand.

Policy innovations initiated within the Grains Group include the following:—

Introduction of the 1970 LIFT program (see p. 542), which substantially reduced the wheat surplus and shifted production into more marketable patterns; Canadian exports of feed grains have risen to record levels over the past two years.

Revision of the quota delivery system to move grain forward to terminals, as required by market opportunities.

Revision of cash advance legislation to make it more adaptable to changing marketing conditions.

Announcement of initial payments for wheat, oats and barley and of initial quotas by Mar. 1 prior to the commencement of each crop year, in order that producers might have direct production guidance before seeding is begun.

Analysis of the alternative marketing systems available for rapeseed.

Cost analyses of the transportation system.

An income stabilization plan was devised, which awaits legislative action.

### Marketing

With the objective of achieving a sustained expansion of the total effective market for Canadian grains and oilseeds, the Government has established a market development program which is designed to expand export markets and to secure the maximum return from grains and oilseeds sales. A Market Development Fund of up to \$10,000,000 annually has been created to promote, initially, the marketing of grains and oilseeds. Provision for other agricultural products is also included. These monies will be expended both on pro-

motion and on capture of a larger share of existing domestic and export markets for food and feed and also on research into new products and uses for Canadian grains. Federal financial assistance to projects originating in the private sector is now available. Such assistance is open to Canadian companies, agencies, industry associations, universities, institutes, and similar entities which undertake projects that have a reasonable probability of contributing to a sustained increase in grains and oilseeds sales.

### Credit

In a policy statement made in 1968, the Prime Minister pronounced the Government's determination to maintain and improve Canada's share of the world wheat trade. In the furtherance of this objective, the Prime Minister stated, among other things, that wheat and flour would continue to represent an important share of the increasing expenditure on aid to developing countries and indicated the Government's intention to review and amend credit facilities available to improve the competitive position of Canadian wheat on world markets. Prior to 1969, Canadian credit sales of wheat and barley were generally facilitated in two ways. (1) Under Sect. 11 of the Canadian Wheat Board Act, sales were made on terms of 25 p.c. cash with the balance repayable over an 18-month credit period at interest rates based on the Wheat Board's rate for borrowing from chartered banks, backed by government guarantee. This facility helped to move between 50,000,000 and 100,000,000 bu. annually in the three years up to 1968-69. (2) Under Sect. 21 of the Export Credit Insurance Act (now replaced by the Export Development Corporation Act), the Canadian grain trade offered terms of up to three years at commercial rates of interest. This facility helped to move between 6,000,000 and 18,000,000 bu. annually in the three years up to 1968-69.

Since the mid-1950s there has been an increasing trend on the part of major grain exporting nations to utilize government-assisted credit programs to achieve grain sales abroad. In 1968-69, at least 30 p.c. of the world trade in wheat and flour was under such programs. Major competitors of Canada generally offered more liberal terms than those available from Canada.

In March 1969, the Cabinet approved expanded financial facilities to make Canadian wheat and flour exports more competitive as well as to provide flexibility to those developing countries that may prefer to receive a relatively large amount of food on concessional payment terms rather than a small amount on a grant-aid basis. These facilities had two distinct elements: (1) the extension of medium-term credit up to three years if necessary, at competitive interest rates to developing countries; and (2) the extension of credit at subsidized interest rates on terms exceeding three years to eligible countries. A substantial contribution to the volume of Canadian grain exports has been made since the inception of this program. Sales of grain on credit in the 1970-71 crop year reached a record 145,000,000 bu. and the Government's liability on credit sales of grain on July 31 was more than \$350,000,000.

### Food Aid

The Canadian Food Aid Program was expanded in 1963 when the Minister of the (then) Department of Trade and Commerce announced the Government's intention to increase on a progressive basis the amount of Canadian food aid, in appropriate relationship to the total of the country's assistance activities. Since 1963, food aid under bilateral and multilateral aid programs administered by the Canadian International Development Agency has moved increasingly larger amounts of wheat and flour. Wheat and flour shipments have generally accounted for about 90 p.c. of Canada's food aid over the past few years. Total food aid allocations rose from \$2,000,000 in 1962-63 to \$100,000,000 in 1966-67. Aid shipments of wheat and flour are contributing significantly to the total volume of grain exports. In the five-year period 1965-70, an annual average of 33,000,000 bu. of aid wheat and flour were shipped abroad compared with 6,900,000 bu. in the previous five years. In 1970-71, aid shipments of wheat and flour totalled 37,600,000 bu. Some of the countries that have

been among the largest recipients of Canadian aid expect to become self-sufficient in food grains in the very near future, but because of the uncertainties of climatic conditions and other factors in production, such as disease and pest control, it is expected that grains and their products will continue to be an important component of Canada's aid program.

### **Production**

In addition to the 1970 LIFT Program, the Government has initiated a Grassland Incentive Program to encourage increased forage acreage. The Program involves the expenditure of some \$40,000,000 over the three years commencing in 1971 to encourage the diversion of cultivated land into grassland up to a total of 4,000,000 acres.

A new departure by the Government, intended to provide producers with relevant information on which to base their seeding plans rather than having to rely on what has happened in the past, has been the initiation in March 1971 of an annual feature, namely, the announcement of initial payments for wheat, oats and barley on Mar. 1 for the subsequent crop year. Simultaneously with the announcement of initial payments, minimum quota levels for the following crop year were also announced. Again this will be part of an annual endeavour to help producers decide on the basis of more relevant information what their seeding plans should be each season. These announcements will be accompanied by the most up-to-date market outlook for the crops on which these indicators will be provided.

### **Grain Receipts Stabilization**

Government proposals for a Grain Receipts Stabilization Plan are at present (February 1972) before Parliament. Basically, the Prairie Grain Stabilization Account would be self-sustaining, based on Government and producer contributions, and the account would pay to grain farmers collectively for any crop year for which the payment is made, an amount equal to the difference between total eligible farm cash receipts for that crop year and the average of such receipts for the preceding five years.

As part of its effort to improve the farm income situation of grain producers in Canada, the Government has also established a minimum selling price for wheat sold in that portion of the market over which the Government can exert control, namely, the domestic market. Producers will receive \$3 per bu. for wheat used in domestic human consumption, based on No. 1 C.W. Red Spring wheat in store at Thunder Bay. The Federal Treasury will pay the difference between the selling price to millers of \$1.95½ per bu. and the \$3.

### **Grain Handling and Transportation**

In order to improve the efficiency of grain transportation within Canada, two significant changes in operating the present system have taken place recently.

The Canadian Wheat Board introduced a Block Shipping System to ensure that the type and grade of grain required for export is loaded in the country in an orderly fashion. Instead of allocating cars to individual elevator points as previously and loading whatever grain was available at that point, cars are now allocated by geographical area or block and the grain handling companies themselves allocate the cars to specific points that have the required grain available.

Port co-ordinators have been appointed at Vancouver and Thunder Bay to ensure the smooth day-to-day movement of grain through those ports. As the co-ordinators monitor the performance of individual components of the system, they are in a position to take remedial action as operating problems arise. Thus, cars of grain can be diverted from an elevator at the port that would not be able to unload them on the day of receipt to another elevator that could unload them immediately. Similarly, the requirements of arriving ocean shipping are studied to eliminate as far as possible the need for the ships to call at more than one elevator for the grain they require. The co-ordinators and their staff are employed by the Canadian Transport Commission.

These changes contributed in no small measure to the record movement of grain for export during the 1970-71 crop year when 705,000,000 bu. of grains and oilseeds were exported. Present indications are that exports for the 1971-72 crop year will be of the same order of magnitude.

The Grains Group are carrying out a detailed examination of the present grain handling and transportation system together with alternative systems to discover whether changes could be made to the present system that would increase Canada's competitive position in world markets and, as well, provide cost benefits to producers. It is anticipated that the results of these studies will be available early in 1972 for discussion and evaluation by interested parties.

### **The Canadian Grain Commission**

The Canadian Grain Commission was established by the Canada Grain Act (SC 1970-71, c. 7) on Apr. 1, 1971. It replaced the Board of Grain Commissioners for Canada which was originally established by the Canada Grain Act of 1912. It is composed of a Chief Commissioner and two Commissioners and is under the jurisdiction of the Canada Department of Agriculture. The headquarters offices of the Commission and its various Divisions are located at Winnipeg and its other offices are situated across Canada, the largest units being at the port areas of Vancouver, Thunder Bay and Montreal. Total staff is approximately 1,000.

The Commission is responsible for the administration of the Act, including the inspection, weighing and storage of grain; the fixing of maximum tariffs of charges for licensed elevators; the establishment of grain grading standards; and the operation of the Canadian Government elevators system.

All operators of elevators in Western Canada and of elevators in Eastern Canada that handle western-grown grain for export, as well as grain dealers in Western Canada, are required to be licensed by the Commission and to file security by bond or otherwise as a guarantee for the performance of all obligations imposed upon them by the Canada Grain Act or by the Canada Grain Act Regulations. On a fee basis, the Commission provides mandatory official inspection, grading and weighing of grain, as well as registration of terminal elevator and eastern elevator receipts. The Economics and Statistics Division is the basic source of statistics relating to grain handled through the Canadian licensed elevator system.

The Commission's Research Laboratory conducts surveys of the quality of each year's grain crops and of grain moving through the Canadian elevator system. It provides information on the quality of various varieties and grades of grain to the Inspection Division, collaborates with plant breeders in studies on new grain varieties and undertakes basic research in relation to quality characteristics of cereal grains and oilseeds.

The Canadian Government elevators, which are managed and operated by the Commission as licensed terminal elevators, are located at Moose Jaw, Saskatoon, Calgary, Edmonton, Lethbridge and Prince Rupert.

In the Prairie Provinces, the Commission has four Assistant Commissioners—one in Alberta, two in Saskatchewan and one in Manitoba—who investigate complaints of producers and inspect periodically the primary (country) elevators in their respective provinces. All grain elevators with their equipment and stocks of grain are subject to inspection by officials of the Commission at any time.

The Commission sets up western and eastern grain standards committees which participate in establishing grain grades and grade specifications, and recommend standard and export standard samples for various grades of grain. It also appoints grain appeal tribunals to give final decisions in cases where appeals are made against the grading of grain by the Commission's inspection officials.

### The Canadian Wheat Board

The Canadian Wheat Board was established under the Canadian Wheat Board Act of 1935 for the purpose of "the marketing in an orderly manner, in interprovincial and export trade, of grain grown in Canada" and now operates under RSC 1970, c. C-12.

This legislation established the Wheat Board as the sole marketing agency for Prairie wheat, oats and barley that is sold interprovincially or internationally. Other crops, such as rye, rapeseed, flaxseed, buckwheat and mustard are marketed by the private grain trade.

The Wheat Board's marketing responsibilities fall into three general areas—market development, the negotiation of sales, and the delivery of grain to customers.

Developing markets for Canadian grain is a complex task that involves promotion, research and extensive analysis of customer requirements. Information on crop production, grain prices, trade regulations, developments in milling and feeding industries, economic conditions and policy changes in countries around the world flow into the Wheat Board's offices in Winnipeg continuously. This information is augmented through first-hand discussions with buyers by senior Wheat Board personnel who travel extensively to overseas markets for Canadian grain. The market information that is acquired in this way enables the Wheat Board to react quickly to changing events and to develop effective programs for the sale of Prairie grain.

The sale of Prairie-grown wheat, oats and barley is essentially carried out in one of two ways—sales negotiated directly by the Wheat Board, and those negotiated through grain exporting companies acting as agents of the Wheat Board. Sales to such countries as the Soviet Union, the People's Republic of China, Brazil and Peru have traditionally been negotiated directly by the Wheat Board. Sales to such countries as the United Kingdom, Japan and the Federal Republic of Germany are usually made through Wheat Board export agents.

The grain exporting companies, however, are involved in the sale of all Wheat Board grains. The detailed arrangements for sales negotiated by the Board are carried out by the exporters after the terms of the contract have been established. On the other hand, when an exporting company completes a sale, in its capacity as an agent of the Board, it is responsible for the entire transaction, including the purchase of grain from the Board and the delivery of the grain to the customer at the export position or the final point of destination. The customer's preference is a key consideration in deciding upon the kind of sales arrangement.

The ability to deliver the kinds, grades and quantities of grain needed by customers is essential to the Wheat Board's marketing program. This is done in two stages. The first stage involves the delivery of grain by the producer from his farm to the local country elevator. The flow of grain from farms to country elevators is regulated under a delivery quota system which enables the Wheat Board to call for the delivery of the kind and grade of grain required to meet market commitments and, at the same time, allocate delivery opportunities equitably among all grain producers. The second stage involves the movement of grain from country elevators to large terminal positions in Eastern Canada, at Thunder Bay, at Churchill and on the West Coast. The transportation of grain to terminals on the West Coast, at Thunder Bay and at Churchill is carried out by the railways under maximum tariffs established under the terms of the National Transportation Act. The forwarding of grain from Thunder Bay to eastern positions is done largely by lake vessels under freight rates negotiated by the Wheat Board and private shippers with lake vessel operators.

Extensive planning and a high degree of co-ordination within the grain handling and transportation industry are required to carry out the complex task of moving grain from country elevators to forward positions. The Wheat Board, which co-ordinates the entire movement, programs rail shipments from country elevators to terminals on a weekly basis in accordance with sales requirements.

The maximum charges for the handling and storing of grain in country elevators and terminals are established by the Canadian Grain Commission. The charges paid at country elevators are the subject of a handling agreement negotiated between the Wheat Board and the country elevator companies.

Oats and barley sold by the Wheat Board for use in Canada are marketed either on a straight cash basis at prices quoted daily by the Board or on the basis of exchange of futures concluded through the facilities of the Winnipeg Grain Exchange. The Board controls the movement of coarse grains to Thunder Bay but the private trade is responsible for the movement of oats and barley from Thunder Bay or Vancouver positions.

The producer receives payment for his wheat, oats and barley in two stages. An initial payment price is established prior to the start of a crop year by Order in Council. The initial payment price less the cost of handling grain at the local elevator and the transportation costs to Thunder Bay or Vancouver is the initial price received by the producer. This price is a guaranteed floor price in that if the Wheat Board, in selling the grain, does not realize this price and the necessary marketing costs, the deficit is borne by the Federal Treasury. In the case of western Canadian wheat sold for domestic human consumption, the Federal Government has established a minimum selling price of \$1.95½ per bu. based on No. 1 C.W. Red Spring wheat in store at Thunder Bay. With very few exceptions, the wheat, oats and barley pool accounts operated by the Board on behalf of producers have shown a profit.

After the end of the crop year when the Board has sold all the grain or otherwise disposed of it in accordance with the Canadian Wheat Board Act, the Board, if authorized by Order in Council, makes a final payment to producers.

Under the Prairie Grain Advance Payments Act, administered by the Board, producers may receive, through their elevator agents, cash advances on farm-stored grain in accordance with a prescribed formula. The purpose of this legislation is to make cash available to producers pending delivery of their grain under delivery quotas established by the Board. Cash advances are interest-free to producers.

Western Canadian producers receive the price for their grain that the Wheat Board receives, less its operating costs including carrying charge, and the general level of prices received by the Board is determined by competitive conditions in world markets. Under provisions of the Temporary Wheat Reserves Act, the Minister of Finance, out of the Consolidated Revenue Fund, pays to the Wheat Board the carrying charges on wheat in commercial storage at the end of the crop year in excess of 178,000,000 bu.

### **The Canadian Grains Institute**

The Canadian Grains Institute was established jointly, in 1971, by the Canadian Wheat Board and the Canadian Grain Commission in co-operation with the Federal Government and is located in Winnipeg. It represents a further initiative by these agencies and the Government in the area of market development for grains and oilseeds and their products. The Institute will place emphasis on courses dealing with practical managerial, institutional, economic and commercial aspects of the Canadian grains industry. As an institutional facility, it will provide for foreign and Canadian industry executives, technical personnel, current and prospective buyers and users of Canadian products, and others likely to influence outlets for them, the opportunity to acquire training and first-hand knowledge of all facets of the industry, including production, marketing, distribution and processing.

In addition, the Institute will offer courses demonstrating the technology of milling, baking, pasta manufacturing, feed mill operations, oilseed crushing and utilization, malting, brewing and distilling. The entire program is designed to contribute to the maintenance and enlargement of markets at home and abroad for Canadian grains, oilseeds and their products.

### **The Canada Grains Council**

At the Prime Minister's suggestion, the Canada Grains Council was established in 1969 primarily to improve co-ordination within the industry and to assist in reaching consensus within the industry on recommendations to government. The administrative costs of the Council are shared by the Government and the industry members. Membership is "open to all non-governmental organizations and associations whose members are directly engaged in the production, handling, transportation or marketing of grain and grain products". The Council now (February 1972) has 30 members who meet semi-annually; its Board of Directors meets about 10 times a year. The Council is serviced by a small, but very efficient, secretariat.

In its three years of operation, the Council has demonstrated the capacity of the industry to work together on matters of mutual interest. It has already made several recommendations to government on issues either referred to it by government or initiated by the Council itself.

### **Subsection 2.—Controls Over Farm Products Other Than Grain\***

The Government of Canada and provincial governments have, through legislation and in other ways, given marketing aids such as those related to research, education, information, inspection, grading and many other service measures of this type, designed to assist in making adjustments in marketing within agriculture and between agriculture and the remainder of the economy. Closely related is regulatory action designed to protect the consumer.

Producers have been concerned about another type of market control, namely that which will give either their organizations or a government agency influence over the price received. In a highly specialized commercial agriculture such as Canada now has, the producer is dependent on the price of his product for his livelihood. Canadian farmers have long attempted to obtain some measure of market control through voluntary organizations, mainly marketing co-operatives. All provinces have made provision for the incorporation of such co-operatives and most, if not all, have provided other assistance to them. In the federal field, the Agricultural Products Co-operative Marketing Act provides for assistance to groups of producers who may wish to market on a co-operative basis.

Other legislation provides for legal control over the marketing of agricultural products, either by a producer board or a government agency. Legislation of this type includes that pertaining to milk control boards, to producer marketing boards and to industry marketing commissions. Measures pertaining to grain marketing have been reviewed in Subsection 1, pp. 1021-1028, and the Agricultural Stabilization Act, which provides price support for certain key products is discussed in the Agriculture Chapter, pp. 536-537.

**Product Controls.**—The federal and provincial departments of agriculture co-operate in establishing and enforcing grades of quality standards for various foods. Some control over size and type of containers used for distribution of agricultural products is exercised by the Canada Department of Agriculture, and the Department of Consumer and Corporate Affairs enforces regulations pertaining to weights and measures (see p. 1040).

Controls related to health and sanitation in food handling are developed and enforced at all three levels of government—municipal, provincial and federal. Examples of provincial and municipal action include laws pertaining to the pasteurization of milk, inspection of slaughter-houses and sanitary standards in restaurants. At the federal level, inspection by the Health of Animals Branch of the Department of Agriculture of all meat carcasses that enter into interprovincial trade is required. The Food and Drug Directorate of the Department of National Health and Welfare has wide control over the composition of foods and over advertising of foods and drugs.

\* Prepared in the Economics Branch, Canada Department of Agriculture, Ottawa.

**Marketing Controls.**—*The Agricultural Products Co-operative Marketing Act.*—In the late 1930s, the Federal Government decided to assist orderly marketing by encouraging the establishment of pools which would give to the producer the maximum sales return for his product, less a maximum margin for handling expenses agreed upon in advance. Thus, the Agricultural Products Co-operative Marketing Act and the Wheat Co-operative Marketing Act were passed in 1939. The latter was used in one year only but the Agricultural Products Co-operative Marketing Act (RSC 1970, c. A-6), which covers the marketing of all agricultural products except wheat produced in the Canadian Wheat Board area, has served agricultural producers continuously since 1939.

The purpose of this Act is to aid farmers in pooling the returns from sale of their products by guaranteeing initial payments and thus assisting in the orderly marketing of the product. The Government may undertake to guarantee a certain minimum initial payment to the producer at the time of delivery of the product, including a margin for handling; sales returns are made to the producer on a co-operative plan. The guaranteed initial payment may be up to a maximum of 80 p.c. of the average price paid to producers for the previous three years, the exact percentage to be recommended by the Minister of Agriculture who enters into an agreement with the selling agency for the product. During 1969, agreements were made for the marketing of apples for processing in Quebec and beans in Ontario.

**Milk-Control Legislation.**—Most of the provinces enacted milk-control legislation prior to 1940. Most provinces finance these milk-control agencies partly from public funds and partly through the collection of licence fees and assessments from those engaged in the fluid milk industry. Milk-control agencies have the authority to license those engaged in the fluid milk industry and can revoke licences for failure to conform with the orders of the milk-control board.

In all provinces with such boards, the milk-control board or similar agency sets the minimum price which distributors in specified markets may pay producers for Class I milk, that is, milk actually sold for fresh fluid consumption. In British Columbia, a formula is used as a guide in determining minimum prices to producers. Most provinces set either minimum or maximum wholesale and retail prices for fluid milk. Quebec sets a minimum and maximum price range. Saskatchewan sets minimum prices applicable to all retail milk sales and maximum prices applicable to milk sales from retail wagons, as well as a minimum-maximum price range at the wholesale level. Minimum prices are in effect in Alberta, Nova Scotia and New Brunswick. Maximum prices are set in Manitoba and no control is exercised over milk prices at the wholesale and retail levels in Ontario and British Columbia. In these three provinces some degree of price competition has developed between store sales and home delivery.

The powers given to or requirements made by milk-control boards include: (1) authority to inquire into all matters pertaining to the fluid milk industry, to define market areas, to arbitrate disputes, to examine the books and records of those engaged in the industry, to issue and revoke licences, and to establish a price for milk; and (2) authority to require a bond from distributors, periodic reports from distributors, payments to be made to producers by a certain date each month, distributors to give statements to suppliers, distributors to give notice before ceasing to accept milk from any producer, and producers to give notice before ceasing to deliver milk to any distributor.

The Ontario Milk Marketing Board, a producer-controlled agency, was officially established by the Milk Commission of Ontario on Nov. 1, 1965. The Board was delegated certain powers by the Commission in respect to the production, marketing and transportation of milk and has the power to set the price that milk processors must pay to their suppliers.

**The Canadian Dairy Commission.**\*—The Canadian Dairy Commission was established by federal legislation and began operations on Apr. 1, 1967. This was a new departure in the area of agricultural marketing because it was the first national marketing board to be

\* See also p. 537.

established since the Canadian Wheat Board was created in 1935. The Commission has the power to purchase any dairy product and package, process, store, ship, insure, import, export, or sell or otherwise dispose of any dairy product purchased by it. The Commission may also make payments to producers of milk and cream for the purpose of stabilizing the price of these products.

The objects of the Commission are to provide producers of milk and cream with the opportunity of obtaining a fair return for their labour and investment, and to provide consumers with a continuous and adequate supply of high-quality dairy products. The Federal Government, through the Canadian Dairy Commission, supports the income of manufacturing milk and cream producers by means of "offer-to-purchase" programs for certain dairy products and direct subsidy payments.

In the 1967-68 dairy support year, the Federal Government introduced a global subsidy eligibility quota which was directly related to the domestic consumption of milk marketed by manufacturing milk and cream shippers. Individual quotas were allocated on the basis of the shipper's deliveries during the previous dairy support year, with certain exceptions. The quota policy, with slight modifications, continues.

*Producer Marketing Boards.*—During the 1930s strong support developed for legislation whereby agricultural producers could exercise legal authority under certain conditions to control the marketing of their produce. The Natural Products Marketing Act of 1934 attempted to provide this power at the federal level but proved *ultra vires*. The Natural Products Marketing (British Columbia) Act, 1936 was *intra vires* of provincial government powers and provided the model from which marketing board legislation has evolved in all 10 provinces.

While marketing board legislation has been revised from time to time on the basis of experience and there are variations in detail from province to province, the same basic powers are given to producers in all provinces. These powers include authority for a duly constituted producer board to control the marketing of 100 p.c. of a specified commodity produced in a designated area. A producer board, in at least some provinces, may set production quotas for each farmer. One producer board may control the marketing of several related commodities and the designated area may be either the whole or part of a province. A producer vote is usually required to establish a producer marketing board whose powers are delegated either by a provincial marketing board, which has certain supervisory authority, or by the Lieutenant-Governor in Council.

The powers of a producer marketing board provided by provincial legislation are necessarily limited to intraprovincial trade. Under the Agricultural Products Marketing Act (RSC 1970, c. A-7), the Federal Government may delegate to a marketing board with respect to interprovincial and export trade similar powers to those obtained with respect to intraprovincial trade under provincial authority. This Act also gives the Governor in Council the right to authorize a provincial marketing board to impose and collect levies from persons engaged in the production and marketing of commodities controlled by it for the purposes of the board, the creation of reserves and the equalization of returns.

In 1970, there were 94 producer marketing boards operating in Canada, including the Canadian Wheat Board which was established at the federal level. All of the provinces had one or more boards established under their jurisdictions; Quebec had 33 and Ontario 22. It is estimated that approximately 47 p.c. of the 1970 farm cash income was received from sales made under the control of producer marketing boards. Commodities sold through the boards included grains, hogs, milk, fruits, potatoes and other vegetables, tobacco, poultry, wool, soybeans, honey, maple products and pulpwood. At the end of 1970, 57 of the provincial boards had received extension of powers for purposes of interprovincial and export trade from the Federal Government, and five boards had received authority to collect levies from producers on commodities marketed through them.

## Section 2.—The Department of Consumer and Corporate Affairs

Legislation that received Royal Assent on Dec. 21, 1967 (RSC 1970, c. C-27), transformed the former Department of the Registrar General of Canada into the new Department of Consumer and Corporate Affairs. The duties, powers and functions of the Minister extend to and include all matters over which the Parliament of Canada has jurisdiction, not by law assigned to any other department, branch or agency of the Government of Canada, relating to consumer affairs; corporations and corporate securities; combines, mergers, monopolies and restraint of trade; bankruptcy and insolvency; and patents, copyrights and trade marks.

The Department has three main divisions—the Bureau of Consumer Affairs, the Bureau of Corporate Affairs, and the Office of the Director of Investigation and Research under the Combines Investigation Act. The Bureau of Consumer Affairs co-ordinates government activities in the field of consumer affairs. Branches within the Bureau include Consumer Services, Consumer Research, Operations and Standards. Regional offices have been established at Halifax, Montreal, Toronto, Winnipeg and Vancouver. Branches of the Bureau of Corporate Affairs include Bankruptcy (with regional offices in Montreal, Toronto and Vancouver), Corporations, Trade Marks, the Patent and Copyright Office, the Registration Division, and the Corporate Research Branch. Branches under the direction of the Office of the Director of Investigation and Research under the Combines Investigation Act include the Combination Branch, the Merger and Monopoly Branch, the Trade Practices Branch and the Research Branch. The Director also has special investigators in each of the five regional offices whose job is investigation of cases of misleading advertising. The Restrictive Trade Practice Commission (Combines Investigation Act) is also domiciled in the Department and reports directly to the Minister.

Branches which serve the Department as a whole are Financial and Administrative Services, Personnel and Information and Public Relations.

### Combines, Mergers, Monopolies and Restraint of Trade

The purpose of Canadian anti-combines legislation is to assist in maintaining free and open competition as a prime stimulus to the achievement of maximum production, distribution and employment in a system of free enterprise. To this end, the legislation seeks to eliminate certain practices in restraint of trade that serve to prevent the nation's economic resources from being most effectively used for the advantage of all citizens.

By amendments that came into force on Aug. 10, 1960, all the provisions of the anti-combines legislation which previously had been divided between the Combines Investigation Act (now RSC 1970, c. C-23) and the Criminal Code were amended and consolidated in the Act. The substantive provisions now are contained in Sects. 2, 32, 33, 34, 35, 36 and 38 of the Combines Investigation Act. The Act was enacted in 1923 and was amended extensively in 1935, 1937, 1946, 1949, 1951 and 1952 as well as in 1960. On July 31, 1969, Sec. 306 of the Criminal Code prohibiting false or misleading advertisements was transferred to the Act (now Sect. 37).

Sect. 32, generally speaking, forbids in Subsect. (1) combinations that prevent or lessen "unduly" competition in the production, manufacture, purchase, barter, sale, storage, rental, transportation or supply of an article of trade or commerce or in the price of insurance. Subsect. (1) derives from Sect. 411 of the Criminal Code which was enacted originally in 1889. Although Subsect. (2) provides that no person shall be convicted for participation in an arrangement relating only to such matters as the exchange of statistics or the defining of product standards, etc., Subsect. (3) provides that Subsect. (2) does not apply if the arrangement has lessened or is likely to lessen competition unduly in respect of prices, quantity or quality of production, markets or customers or channels of distribution, or if the arrangement "has restricted or is likely to restrict any person from entering into or expanding a business in a trade or industry". Subsect. (4) provides that, subject to Subsect. (5), no person shall be convicted for participation in an arrangement which

relates only to the export trade. Subsect. (5) provides that Subsect. (4) does not apply if the arrangement has had or is likely to have harmful effects on the volume of export trade or on the businesses of Canadian competitors or on domestic consumers.

Sects. 2 and 33 make it an offence to participate in a merger that has or is likely to have the effect of lessening competition to the detriment or against the interest of the public. These Sections also make it an offence to participate in a monopoly that has been operated or is likely to be operated to the detriment or against the interest of the public.

Sect. 34 deals with what are commonly called "price discrimination" and "predatory price cutting". It provides that a supplier may not make a practice of discriminating among those of his trade customers who come into competition with one another by giving one a preferred price which is not available to another if the second is willing to buy in like quantities and qualities as the first; it also forbids a supplier from selling at prices lower in one locality than in another, or unreasonably low anywhere, if the effect or tendency of such policy is to lessen competition substantially or eliminate competitors or the policy is designed to have such effect.

Sect. 35 provides that where a supplier grants advertising or display allowances to competing trade customers he must grant them in proportion to the purchases of such customers; any service he exacts in return must be such that his different types of customers are able to perform; and if such customers are required to incur expenses to earn such allowances, such expenses also must be proportionate to their purchases.

Sect. 36 makes it an offence for any person, for the purpose of promoting the sale or use of an article, to make any materially misleading representation to the public concerning the price at which such or like articles have been, will be or are ordinarily sold.

Sect. 37 makes it an offence to publish an advertisement containing a statement that purports to be a statement of fact but is untrue, deceptive or misleading or is intentionally so worded or arranged that it is deceptive or misleading if the advertisement is published to promote a business or commercial interest or the sale or disposal of property.

Sect. 38 prohibits a supplier of goods from prescribing the prices at which they are to be resold by wholesalers or retailers or from cutting off supplies to a merchant because of the merchant's failure or refusal to abide by such prices, i.e., the practice of "resale price maintenance". The Section also provides that it shall not be inferred that a person practised resale price maintenance simply because he refused or counselled the refusal of supplies to a merchant if there were reasonable cause to believe and the supplier did believe that the merchant was making a practice of using articles of such supplier as "loss-leaders" or as bait advertising or was making a practice of engaging in misleading advertising in respect of such articles or of not providing services that purchasers of such articles might reasonably expect.

The Director of Investigation and Research is responsible for investigating combines and other restrictive practices, and the Restrictive Trade Practices Commission is responsible for appraising the evidence submitted to it by the Director and the parties under investigation, and for making a report to the Minister of Consumer and Corporate Affairs. When there are reasonable grounds for believing that a forbidden practice is engaged in, the Director may obtain from the Commission authorization to examine witnesses, search premises, or require written returns. After examining all the information available, if the Director believes that it proves the existence of a forbidden practice, he submits a statement of the evidence to the Commission and to the parties believed to be responsible for the practice. The Commission then sets a time and place at which it hears argument on behalf of the Director in support of his statement, and hears argument and receives evidence on behalf of any persons against whom allegations have been made in the statement. Following this hearing, the Commission prepares and submits a report to the Minister of Consumer and Corporate Affairs, ordinarily required to be published within thirty days.

Under the provisions of the Act, general inquiries may be made into restraints of trade which, although not forbidden or punishable, may affect the public interest. The courts, including the Federal Court of Canada,\* in addition to imposing punishment for a contravention of the legislation, may make an order restraining persons from embarking on, continuing or repeating a contravention or directing the dissolution of a merger or monopoly as the case may be. Application also may be made to the courts for such an order in lieu of prosecuting and convicting for a contravention of the legislation. Prosecutions for offences against the substantive provisions of the legislation (other than Sect. 36 which is punishable only on summary conviction) may be taken either in the provincial courts or with the consent of the accused in the Federal Court of Canada.

In July 1969, following a reference by the Government, the Economic Council of Canada submitted its Interim Report on Competition Policy which recommended substantial changes in the Combines Investigation Act. On June 29, 1971, the Minister of Consumer and Corporate Affairs introduced in Parliament Bill C-256 to enact the Competition Act to replace the Combines Investigation Act. The Bill embodies many of the basic suggestions made in the Report of the Economic Council.

In the period Jan. 1, 1968 to June 30, 1971, the following reports of inquiries under the legislation were published:—

- (1) Resale Prices of Corning Glassware.
- (2) Dairy Products, Montreal.
- (3) Resilient Flooring, Toronto.
- (4) Prices of Gasoline, Sudbury.
- (5) Road Paving in Ontario.
- (6) Business Forms.
- (7) Business Forms, Quebec.
- (8) The Metal Culvert Industry, Ontario and Quebec.
- (9) Electric Large Lamps.

These reports and copies of the annual reports under the Act may be obtained from Information Canada or the office of the Director of Investigation and Research, Combines Investigation Act, Department of Consumer and Corporate Affairs, Ottawa.

## Patents

Patents for inventions are issued under the provisions of the Patent Act (RSC 1970, c. P-4) and Patent Regulations have been proclaimed to carry into effect the objects of the Act. Applications for patents for inventions and requests for information about such patents should be addressed to the Commissioner of Patents, Ottawa, K1A 0E1.

Patents granted in the year ended Mar. 31, 1971 numbered 29,193. Of these, 4.8 p.c. resulted from inventions made by residents of Canada, 6.8 p.c. by residents of the United Kingdom and 64.0 p.c. by residents of the United States.

Printed copies of Canadian Patents issued from Jan. 1, 1948 to date are available at \$1 each. The *Patent Office Record*, issued weekly, contains a list of patents issued during the week covered, information about services in the Patent Office and information of concern to the patent profession.

Canadian and foreign patents may be consulted at the Patent Office Library. British patents and abridged specifications thereof from 1617 to date and United States patents from 1845 to date are available, as well as many patents, indexes, journals and reports from Australia, India, Ireland, New Zealand, Pakistan, South Africa, Austria, Belgium, Colombia, Czechoslovakia, Egypt, France, Germany, Italy, Japan, Mexico, the Netherlands, Norway, Sweden, Switzerland and Yugoslavia. A list of the foreign patents available is published in the Patent Office Record.

In March 1971, the Economic Council of Canada completed a Report on Intellectual and Industrial Property, which made recommendations for amendments to the legislation. Copies of the report may be purchased from Information Canada, Ottawa.

**Copyrights, Industrial Designs and Timber Marks**

Copyright protection is governed by the Copyright Act (RSC 1970, c. C-30) in force since 1924. Protection is automatic without any formality, although a system of voluntary registration is provided. Application for registration should be addressed to the Commissioner of Patents, Ottawa.

The Act sets out the qualifications for a copyright and its duration: “Copyrights shall subsist in Canada . . . in every original literary, dramatic, musical and artistic work, if the author was, at the date of the making of the work, a British subject, a citizen or subject of a foreign country which has adhered to the Berne Convention and the additional Protocol . . . or resident within Her Majesty’s Dominions. The term for which the copyright shall subsist shall, except as otherwise expressly provided by this Act, be the life of the author and a period of fifty years after his death.”

Canada belongs to the Universal Copyright Convention. This means that the works of Canadian authors are protected in the United States without formality of compulsory registration or the obligation of printing in the United States, provided that, from the first publication, the work bears in a prominent place the following identification: ©, followed by the name of the proprietor and the year of publication.

Copyright protection is extended to records, perforated rolls, cinematographic films, and other contrivances by means of which a work may be mechanically performed. The intention of the Act is to enable Canadian authors to obtain full copyright protection in Canada, in all parts of the Commonwealth, in foreign countries of the Copyright Union and in the United States. Protection of industrial designs and of timber marks is afforded under the Industrial Design and Union Label Act and the Timber Marking Act. Registers of such designs and marks are kept by the Copyright Branch of the Patent Office.

**Trade Marks**

The Trade Marks Office, a Branch of the Consumer and Corporate Affairs Department, administers the Trade Marks Act (RSC 1970, c. T-10) which covers all legislation concerning the registration and use of trade marks and supersedes from July 1, 1954, former legislation enacted under the Unfair Competition Act, the Union Label Act and the Shop Cards Registration Act. Correspondence relating to an application for registration of a trade mark should be addressed to the Registrar of Trade Marks, Ottawa.

Applications are advertised for opposition purposes in the *Trade Marks Journal*, a weekly publication that also gives particulars of every registration of a trade mark and every registration of a registered user. The required fee payable on application for registration of a trade mark is \$35, for advertisement of an application \$25 and for registration of a person as a registered user of a trade mark \$35.

## Section 3.—Control and Sale of Alcoholic Beverages

The retail sale of alcoholic beverages in Canada is controlled by provincial and territorial government liquor control authorities. Alcoholic beverages are sold directly by most of these liquor control authorities to the consumer or to licensees for resale. However, in some provinces beer and wine are sold directly by breweries and wineries to consumers or to licensees for resale. During the year ended Mar. 31, 1970, provincial government liquor authorities operated 1,233 retail stores and had 217 agencies in smaller centres of population.

Government revenue specifically related to alcoholic beverages and details of sales by value and volume for each province are given below. Statistics Canada report, *The Control and Sale of Alcoholic Beverages in Canada* (Catalogue No. 63-202) shows further detail as well as volume figures of production and warehousing transactions, the value and volume of imports and exports and the assets and liabilities of provincial liquor commissions.

### 4.—Revenue of Provincial and Territorial Governments Derived Specifically from the Control and Sale of Alcoholic Beverages, Years Ended Mar. 31, 1969 and 1970

NOTE.—Figures include revenue collected directly by the provincial and territorial governments as well as revenue of the liquor authorities, but exclude revenue resulting from general retail sales taxation with the exception of the 1969 figures for Quebec, which include \$10,140,000 in sales tax collected at outlets.

## Section 4.—Miscellaneous Aids or Controls

### The National Energy Board

The National Energy Board was established under authority of the National Energy Board Act, 1959 (RSC 1970, c. N-6) for the broad purpose of assuring the best use of energy resources in Canada. The Board is responsible for adjudicating upon applications for exportation and importation of natural gas, for construction and operation of international and interprovincial oil and gas pipelines, for exportation of electric power, for construction and operation of international power lines for importation and exportation of electric power, for importation of liquefied natural gas and motor gasoline and gasoline blending components, and for the regulation of the construction of pipelines passing through municipal and private farm areas to minimize disruption of drainage systems. It is responsible for regulating the rates, tolls and tariffs of oil and gas pipelines under its jurisdiction to ensure that they are just and reasonable. The Board reports to Parliament through the Minister of Energy, Mines and Resources.

In addition to its regulatory responsibilities, the Board has an advisory role. In this capacity it is required to keep under review all matters relating to energy within the juris-

diction of the Parliament of Canada and to recommend to the Minister any measures that the Board considers necessary or advisable to undertake in the public interest to ensure proper use and development of energy and its sources.

The Board is also charged with the administration of the National Oil Policy which is intended to foster the development and utilization of indigenous Canadian oil resources. This objective involves some protection for products of indigenous crude oil in domestic markets, to which the Board's motor gasoline import licensing is related, and encouragement for the export of oil surplus to Canadian requirements.

The National Power Policy, announced in 1963, encourages the development of large-scale power sources at lowest possible cost; the distribution of the benefits thereof as widely as possible through interconnections between power systems within Canada; and the long-term export of large blocks of power where such exports will induce early development of Canadian power resources. This policy also encourages the export of various classes of power under suitable interconnection agreements to provide for mutual assistance in emergencies and for other economic benefits that can be derived by both parties through co-ordinated operation and development. In pursuance of these aims, the Board co-operates with other agencies in the consideration of interprovincial and international interconnections of electric power systems. In this context it is worthy to note that now almost all electrical utilities in Canada and the United States are interconnected with neighbouring systems and are operating as part of one vast power network.

In 1971, the Board convened its first public hearing under Part IV of the Act for the determination of just and reasonable tolls for a major gas pipeline company. It is anticipated that this hearing will be both lengthy and complex in nature, involving, as it does, many issues that have previously not been subject to the Board's purview.

Also in 1971, the Regulations pursuant to Part VI of the National Energy Board Act were amended to impose a mandatory condition on each licence issued by the Board for the exportation of gas. This condition requires that the price to be charged for such gas shall be subject to continuous review by the Board and where, in the Board's opinion, there has been a significant increase in prices for competing gas supplies or for alternative energy sources, the Governor in Council may, on the recommendation of the Board, order the establishment of a new price.

The Board conducts regular examinations of the accounts and records of gas and oil pipeline companies under its jurisdiction. Such examinations ensure conformity with the Board's Uniform Accounting Regulations and provide detailed financial information which is essential to administering the regulatory functions of the Board. The Board also conducts special studies of a financial nature and maintains close liaison with various sectors of the national and international financial communities.

The Board conducts continuing studies of energy matters in order to maintain a bank of current knowledge which is necessary for the Board to perform its regulatory and advisory functions. Energy supply and demand forecasts are a continuing function of the Board's work. Studies include both the Canadian and foreign markets since fuels and, to a more limited extent, electric power are traded internationally.

Seven members, appointed by the Governor in Council, constitute the Board. Each is appointed for a period of seven years or until the age of 70.

### **The Standards Council of Canada**

The Standards Council of Canada was established by Act of Parliament (SC 1969-70, c. 73), which received Royal Assent on Oct. 7, 1970. The Council will act as a national co-ordinating institution through which organizations concerned with voluntary standardization may co-operate in recognizing, establishing and improving standards in Canada and develop a broader and more energetic Canadian standards program to meet both national

and international responsibilities. Its structure is intentionally designed to make maximum use of those organizations already in existence and functioning efficiently. The aim is to broaden the range of activities and to co-ordinate them in order to obtain a more complete coverage of standards needs.

The objects of the Council are to foster and promote voluntary standardization in fields relating to the construction, manufacture, production, quality, performance and safety of buildings, structures, manufactured articles and products and other goods, including components thereof, not expressly provided for by law, as a means of advancing the national economy, benefiting the health, safety and welfare of the public, assisting and protecting consumers, facilitating domestic and international trade and furthering international co-operation in the field of standards. It will be responsible in the private sector for encouraging preparations for change to the metric system in a manner to achieve optimum benefits at minimum cost and will ensure that, in the process of rewriting standards to metric terms, there will be an opportunity to update the standards themselves where appropriate.

The Council will consist of not more than 57 members, headed by a president and a vice-president. The seats of the Council, other than the 16 assigned to government representatives (six federal and ten provincial), will be occupied by representatives of national organizations. Membership will be broadly representative of all levels of government (federal, provincial and municipal), primary and secondary industries, distributive and service industries, trade associations, labour unions, provincial associations, consumer associations and the academic community. Members employed in the Public Service of Canada hold office during pleasure. Other members are appointed for a term not exceeding three years. The day-to-day work is carried out by a permanent staff in Ottawa, headed by an executive director who is appointed by the Governor in Council.

### **Trade Standards and Regulations**

In its consumer program, the Department of Consumer and Corporate Affairs is responsible for the administration of broad legislation which affects the business community. Policies and programming are determined by the Standards Branch, and the necessary field supervision by the Operations Branch.

**Hazardous Products.**—General regulations issued under the Hazardous Products Act provide for the banning or the regulated sale of a variety of dangerous products which are toxic, flammable, explosive, or corrosive. These relate largely to household products. Toy Regulations are directed to eliminating dangerous toys.

**General Commodity Field.**—The National Trade Mark and True Labelling Act provides a framework for the development of National Standards and true labelling in order to prevent deception in labelling and advertising. The Garment Sizing Regulations were developed as a National Standard for the sizing of children's garments. The labelling provision has been used for regulation for fur garments, watch jewels, textiles, etc. Textiles are subject to special new requirements established under a Textile Labelling Act passed in 1970.

Control of marking of precious metal articles is maintained under the Precious Metals Marking Act. This Act will shortly be replaced by a revised statute passed by Parliament.

In the packaging and labelling field, a Packaging and Labelling Act has been passed by Parliament which, when proclaimed, will give uniformity to packaging practices in Canada, reduce packaging and advertising deception, and control proliferation.

**Food.**—In areas of health, grading, standards and composition, the Food and Drug Act, the Canadian Agricultural Products Standards Act and the Fish Inspection Act are generally applicable. The Consumer and Corporate Affairs Department is charged with

administration of the economic fraud aspects in distribution. This responsibility relates mainly to labelling and advertising in any segment of the news media.

**Advertising.**—Most legislation has particular requirements to ensure against misleading advertising. Notice should be taken of Sects. 36 and 37 of the Combines Investigation Act, which include general provisions against misleading advertising practices.

**Measurement.**—The Weights and Measures Act prescribes the legal standards of weight and measure for use in Canada; it also requires control of the type of all weighing and measuring devices used for commercial purposes and their periodic verification and surveillance directed toward the elimination of device-tampering and short-weight sales. A replacing Act has been passed by Parliament and will be proclaimed with the issue of new regulations. The fundamental objectives of existing legislation are unchanged. The new Act is an updating, and complements the proposed packaging and labelling legislation.

The Electricity Inspection Act and the Gas Inspection Act control the approval before sale and use of devices used for the sale of electricity and gas; they also provide a framework for continual in-use inspection.

### PART III.—BANKRUPTCIES AND COMMERCIAL FAILURES

Two series of figures are included in this Part which, although closely related as far as subject matter is concerned, cover different aspects of the field of bankruptcies and commercial failures. The first, under the heading of "Administration of Bankrupt Estates" is limited to the supervision, by the Superintendent of Bankruptcy, of the administration of bankrupt estates under the Bankruptcy Act (RSC 1970, c. B-3); it gives information on the amounts realized from the assets as established by debtors and indicates that values actually paid to creditors are invariably very much lower than such estimates alone would imply. It can therefore be assumed that this applies in even greater degree to the more extended fields covered in the second section under the heading of "Returns under the Bankruptcy and Winding-Up Act" which is compiled by Statistics Canada. This series is limited to bankruptcies and insolvencies made under federal legislation and includes business failures only.

**Administration of Bankrupt Estates.\***—The Bankruptcy Act was last revised in 1949 and amended in 1966. The amendments were instigated by exposures and suggestions of illegal and improper practices in connection with bankruptcy proceedings or administration. They do not constitute a complete revision of the Bankruptcy Act but were designed rather to provide, as an interim measure, remedies to the most urgent areas of complaints. They provide the Superintendent of Bankruptcy with direct and immediate authority in the field of investigation and inquiry, and tighten the procedures and requirements in a number of areas, such as that of proposals which an insolvent person may make to his creditors. In other words, these amendments were intended to provide remedies in situations where it had been shown by experience that abuses of the bankruptcy process are most likely to occur. The amendments also contain a new Part X entitled "The Orderly Payment of Debts" which may come into force in any province at the request of the provincial authorities concerned—in Alberta on Apr. 17, 1967, in Manitoba on June 1, 1967, in Saskatchewan on Apr. 1, 1969, in British Columbia on June 1, 1970, in Nova Scotia on July 1, 1970 and in Prince Edward Island in April 1971.

\* Revised by the Superintendent of Bankruptcy, Ottawa.

A report issued annually by the Superintendent of Bankruptcy gives statistics and comments on various activities in the field of bankruptcy, such as prosecution for offences, issue of licences for trustees in bankruptcy, number of estates reported and closed during the year, and costs of bankruptcy administration in Canada.

### 1.—Summary Statistics of Estates Closed during 1970 under the Bankruptcy Act

## PART IV.—PRICES\*

Price statistics primarily take the form of indexes which express prices in each period as a percentage of prices in a designated base period. The indexes measure the movement of prices from period to period. Another less frequent type of price index expresses prices in one location as a percentage of prices in a base location, which is set equal to 100, and measures the comparative levels of prices between places at a point in time.

Summary tables of available price statistics are presented herein relating to general wholesale prices, prices of capital goods and construction, consumer prices, and prices of common and preferred stocks. In addition, statistics on patterns of family expenditure, by income group, are provided in Section 5. For further details, including indexes of selling prices of each of some 100 Canadian manufacturing industries, the reader is advised to consult the monthly Statistics Canada publication *Prices and Price Indexes* (Catalogue No. 62-002). In addition, price indexes relating to merchandise exports and imports (Chap. XXI) are published monthly in Catalogue No. 65-004 and No. 65-007, respectively. Similarly, implicit price indexes for gross national product and its main components (Chap. XXIII) are published quarterly in Catalogue No. 13-001.

\* Prepared in the Prices Division, Statistics Canada.

## Section 1.—Index Numbers of Wholesale Prices

The term "wholesale prices" refers to transactions that occur below the retail level. It relates to sales and purchases of raw materials, semi-processed goods and manufactured products. Indexes of wholesale prices are constructed in two primary ways: (1) on an industry basis, in which the indexes are prepared for individual industries and aggregated for groups of industries; and (2) on a commodity basis, in which indexes are prepared for individual commodities and aggregated for groups of commodities. "Industry Selling Price Indexes" for manufacturing industries are the principal industry-classified indexes available in Canada. The "General Wholesale Index" is the major commodity-classified index.

Wholesale price indexes and individual price series have numerous uses, one of the most important of which is in escalator clauses of contracts where prices quoted are linked to movements of specified price indexes. They are also of major importance in studies of replacement and construction costs in investment projects; analyses of price movements of both individual items and commodity groups in relation to purchases and sales; industrial planning and market analysis; valuations for tax purposes and inventory analysis; and studies of changes in physical volume. Foreign companies also utilize the indexes in assessing the competitive position of Canadian goods.

**Industry Selling Price Indexes (Manufacturing).**—Indexes of the selling prices of some 100 individual industries classified to Manufacturing in the Standard Industrial Classification are produced and published monthly. In addition, indexes are published for 12 major groups of manufacturing industries and a composite gross weighted index for all manufacturing has been introduced recently. The indexes are published monthly in *Prices and Price Indexes* (Catalogue No. 62-002).

The indexes measure the movements through time of prices received by manufacturers for their products. Prices reflected in the index are f.o.b. manufacturers' establishment, excluding excise taxes levied on manufacturers' sales. The items in the current indexes and their weights, indicating their relative importance, are based on manufacturers' shipments in 1961.

The composite gross weighted index for manufacturing is presented in Table 1, for the years 1961-70.

During 1970, the rate of increase in manufacturers' selling prices declined markedly. In January, prices rose 0.8 p.c. above the level prevailing in the preceding month of December 1969. Thereafter, the month-to-month percentage rises in prices softened and in May 1970 the gross weighted index began to decline. Further reductions occurred in subsequent months and, by December 1970, the index was only 0.6 p.c. above its level of December 1969. This was the smallest 12-month increase recorded for manufacturers' selling prices for any month since April 1965.

### 1.—Gross Weighted Industry Selling Price Index (Manufacturing), 1961-70 (1961=100)

NOTE.—The index measures the movements of prices of gross shipments of manufacturing industries, including inter-industry shipments between individual industries within manufacturing. Therefore, it duplicates the movements of some prices in the sense that, for example, flour prices are given full weight as part of the shipments of the flour mills industry and then are implicitly counted again through full weighting of the shipment prices of those manufacturing industries which use flour as an ingredient in their outputs, e.g., bread, biscuits, cakes, etc.

Year	Index	Year	Index	Year	Index
1961.....	100.0	1965.....	104.7	1969.....	116.3
1962.....	101.1	1966.....	107.7	1970.....	119.1
1963.....	102.5	1967.....	109.8		
1964.....	103.3	1968.....	112.1		

**General Wholesale Index.**—The general wholesale index includes mainly manufacturers' prices but also incorporates those of wholesalers proper, assemblers of primary products, agents and operators of other types of commercial enterprises which trade in commodities of a type, or in quantities characteristic of primary marketing functions. Prices are grouped according to a commodity classification scheme based on chief component material similarities. Indexes classified according to degree of manufacture are also available. In Table 2, the general wholesale index is presented for the period 1947-70. This index is used as a conventional summary figure against which to observe the behaviour of particular price groups such as farm products, raw materials and building materials, for which separate price indexes have been constructed. Table 3 gives, for the years 1961-70, the general wholesale price index and two of its integral classifications—raw and partly manufactured goods, and fully and chiefly manufactured goods; also presented are two related systems—industrial materials and Canadian farm products.

**Section 2.—Price Index Numbers of Construction and Capital Goods**

This Section covers price indexes currently available for residential and non-residential building, and engineering construction. Further details concerning these series or developments under way in other areas are available from the Prices Division of Statistics Canada.

The vertical mosaic of Vancouver's burgeoning West End apartment complexes shows clearly the concentration of population in this one small area of the British Columbia city. It is now the second most densely populated region in North America, next to New York City's Harlem.

**Residential and Non-residential Building Construction Indexes.**—Two series of indexes are produced by Statistics Canada measuring price changes for residential and non-residential building construction. These are base-weighted indexes of materials and labour, and are presented in Table 5 for the years 1956-70.

The building materials price indexes are drawn from the system of industry selling price indexes (*Industry Selling Price Indexes 1956-1968*, Catalogue No. 62-528) and relate to a selection of building materials derived from a sample of buildings surveyed after the Second World War. Some modifications have since been introduced into the series (described in *Prices and Price Indexes* for March 1969 and May 1970) and the federal sales tax has been added to the materials indexes as appropriate. The wage rate component is derived from surveys conducted by the Department of Labour for construction trades in various centres; these are base rates and usually reflect union scale or collective agreements. The combined indexes of materials and wage rates do not reflect changes in profit margins or in productivity; implicit price indexes from gross fixed capital formation reflecting these factors are available from the National Income and Expenditure Division of Statistics Canada.

### 5.—Price Indexes of Residential and Non-residential Building Materials and Wage Rates, 1956-70

(1961=100)

NOTE.—Figures from 1935 are available in the May 1970 issue of *Prices and Price Indexes*.

Year	Price Indexes of Building Materials		Construction Wage Rates	Composite Indexes of Materials and Wage Rates	
	Residential	Non-residential		Residential	Non-residential
1956.....	100.1	97.7	75.4	88.2	87.6
1957.....	100.1	99.2	79.9	90.4	90.6
1958.....	99.2	99.0	85.7	92.7	93.0
1959.....	101.3	100.5	91.1	96.4	96.3

1969.....	139.2	126.1	164.5	151.4	143.3
1970.....	137.6	129.5	188.7	162.2	156.1

**Highway Construction Indexes.**—The price indexes of highway construction in Canada express prices paid by provincial governments each year in contracts awarded for highway construction as a percentage of price paid in 1961. The base-weighted indexes measure the effect of price change on the cost of specified programs of new highway construction represented by contracts of approximately \$50,000 or more awarded by provincial governments.

The all-items indexes and their components are useful in planning and budgeting for highway construction programs, in updating previously costed projects, in estimating replacement cost of previously completed road work and in measuring historical price trends. Prices contained in the index are for units of construction work put in place, such as a cubic yard of earth excavation or a ton of bituminous hot-mix paving. Also included are prices of some materials, such as culvert pipe, usually supplied to the contractor by the highways department. (*Prices and Price Indexes* for December 1967 contains details of the problems of estimating price change for highway construction.)

### 6.—Highway Construction Price Indexes for All-Items and Major Components, Seven-Province Composite, Years Ended Mar. 31, 1956-70

<sup>1</sup> Direct comparisons should not be made between this index and the highway index published by the Ontario Department of Highways; the item content is substantially different.

**Electrical Utility Construction Indexes.**—The price indexes of electrical utility construction, which include those of distribution systems, transmission lines, transformer stations and hydro-electric generating stations, give some idea of the impact of price change on the cost of materials, labour and equipment used in constructing and equipping electrical utilities in a specified base period. The index provides an estimate of how much more, or less, it would cost to reproduce the base-period program of construction in another period, using the same construction technology as in the base period and assuming rates of profit and productivity in construction are the same in both periods.

Major uses of the index relate to the estimation of reproduction costs or the deflation of capital formation. Fixed-weighted national input indexes have deficiencies for this purpose which may be alleviated by the use of detailed deflation techniques and through the utilization of specifically appropriate productivity adjustments. (These problems are discussed in Statistics Canada Occasional Paper *Price Indexes of Electric Utility Construction*, Catalogue No. 62-526.)

Prices used in the indexes are, for the most part, selling prices reported monthly by manufacturers for materials or equipment. The price reported is for units and terms of sale representative of the volume sales of the manufacturer. Federal sales tax changes are reflected in the index but no adjustments have been made for provincial tax changes. Until December 1964, wage rate data were supplied by the Department of Labour and represented minimum hourly rates paid to construction workers in major cities employed on Federal Government contracts. In 1965, union basic wage rates reported by major utilities and some contractors were incorporated into the index. The sample selected provides an estimate of wage rate change for urban own-account and contract electrical utility construction.

**Price Indexes of Machinery and Equipment.**—A system of base-weighted price indexes for machinery and equipment has been under development for a number of years, a principal use of which would be the restatement of historical investment costs in terms of price levels of a particular year. At present, only price indexes of construction machinery and equipment have been published and are provided in Table 9.

Prices used in the indexes are, for the most part, selling prices reported monthly by manufacturers, although in some cases distributors' prices are used. Prices of imported machinery and equipment are included in the index, represented either by commodity price indexes of the United States Bureau of Labor Statistics or by prices collected directly from foreign manufacturers. All prices have been adjusted as relevant to include duty, exchange and federal sales tax.

### Section 3.—Consumer Price Index\*

The purpose of the consumer price index is to measure the movement from month to month in retail prices of goods and services bought by a representative cross-section of the Canadian urban population. For a particular article or service, a price index number is simply the price of the article in one period of time expressed as a percentage of its price in a reference period, usually called a base period. However, indexes for individual goods may be combined to form indexes representing prices of broad groups of goods and services. Thus, the consumer price index relates to the wide range of goods and services bought by Canadian urban families. The index expresses the combined prices of such goods each month as a percentage of their prices in the base period 1961.

The group of goods and services represented in the index is called the index "basket" and "weights" are assigned to the price indexes of individual items for purposes of combining them into an over-all or composite index. The weights reflect the relative importance of items in expenditures of middle-size urban families with medium incomes. The basket is an unchanging or equivalent quantity and quality of goods and services. Only prices change from month to month and the index, therefore, measures the effect of changing prices on the cost of purchasing the fixed basket. The basket and weights now used in the index are based on expenditures in 1957 of families of two to six persons, with annual incomes of \$2,500 to \$7,000, living in cities of 30,000 population or over.

#### 10.—Consumer Price Index Numbers, 1947-70

(1961=100)

Year	Index	Year	Index	Year	Index	Year	Index
1947.....	65.6	1953.....	89.4	1959.....	97.9	1965.....	107.4
1948.....	75.0	1954.....	89.9	1960.....	99.1	1966.....	111.4
1949.....	77.4	1955.....	90.1	1961.....	100.0	1967.....	115.4
1950.....	79.6	1956.....	91.4	1962.....	101.2	1968.....	120.1
1951.....	88.0	1957.....	94.3	1963.....	103.0	1969.....	125.5
1952.....	90.2	1958.....	96.8	1964.....	104.8	1970.....	129.7

The behaviour of the consumer price index during the years of almost continuous economic growth following the end of the Second World War up to 1959 is discussed in the 1962 Year Book, pp. 928 and 929, and the movement during 1959-69 in subsequent editions. From 1969 to 1970 the annual average consumer price index increased by 3.4 p.c., which compares with an average increase in the preceding five years of 3.7 p.c. On the basis of the movement in consumer prices, the purchasing power of the 1961 consumer dollar may be said to have dropped from 80 cents in 1969 to 77 cents in 1970.

The major cause of the lower-than-average increase in the consumer price index from 1969 to 1970 was a decline in the rate of increase in the heavily weighted food component. The relatively small increases recorded for the clothing and the tobacco and alcohol indexes were also important factors. On the other hand, the heavily weighted housing component advanced 4.9 p.c. from 1969 to 1970, an increase not too different from its advance from 1968 to 1969, and considerably larger than the average increase for the preceding five years.

Table 11 presents indexes for major components and the all-items index for the period 1961-70. In this classification of commodities and services composing the index, the index items are grouped according to broad categories of use by the consumer.

\* A comprehensive description of the index is contained in the publication *The Consumer Price Index (1949=100)*—Revision Based on 1957 Expenditures (Catalogue No. 62-518). A description of the change in the base period from 1949 to 1961 appears in the January 1969 issue of *Prices and Price Indexes* (Catalogue No. 62-002).

**11.—Consumer Price Indexes for Specific Groups, 1961-70**

(1961=100)

Year	Food	Housing	Clothing	Transportation	Health and Personal Care	Recreation and Reading	Tobacco and Alcohol	All-Items Index
GROUP WEIGHT AS A PERCENTAGE OF TOTAL.....	27	32	11	12	7	5	6	100
1961.....	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0
1962.....	101.8	101.2	100.9	99.9	102.0	100.8	101.3	101.2
1963.....	105.1	102.3	103.4	99.9	104.6	102.2	101.5	103.0
1964.....	106.8	103.9	106.0	101.0	108.0	103.9	103.4	104.8
1965.....	109.6	105.8	107.9	104.8	113.0	105.6	105.1	107.4
1966.....	116.6	108.7	112.0	107.3	116.5	108.6	107.6	111.4
1967.....	118.1	113.4	117.6	111.8	122.5	114.1	110.4	115.4
1968.....	122.0	118.6	121.1	114.7	127.4	119.7	120.4	120.1
1969.....	127.1	124.7	124.5	120.0	133.6	126.8	125.0	125.5
1970.....	130.0	130.9	126.8	124.8	139.5	131.2	126.5	129.7

Items in the index may also be grouped by type of commodity and service, which permits another view of the incidence of changes in prices. Component indexes of this grouping are presented in Table 12. From 1969 to 1970, the commodities index rose 2.1 p.c. compared with an average rise of 3.0 p.c. a year for the preceding five years. The main cause of this lower-than-average increase was a 2.3-p.c. rise in food prices, which was considerably less than the 3.6-p.c. rise on average for the preceding five years. Further, prices of non-durable commodities, excluding food, advanced 2.4 p.c. in 1970, the five-year average rise being 3.1 p.c., and those for durable commodities moved up 1.2 p.c. from 1969 to 1970 in line with the average five-year increase of 1.3 p.c. The services index advanced 5.9 p.c. compared with an average five-year increase of 5.1 p.c. but the 1970 increase over 1969 was considerably less than the 7.0-p.c. advance that occurred from 1968 to 1969.

**12.—Consumer Price Index by Type of Commodity and Service, 1961-70**

(1961=100)

Year	Commodities				Total Services	All-Items Index

1970.....	130.0	123.4	106.2	123.0	145.0	129.7

<sup>1</sup> Includes such items as new passenger cars, household appliances, television and radio sets, furniture, floor coverings and dishes.

<sup>2</sup> Component weights indicate the relative importance of item groups.

Table 13 presents regional consumer price indexes for ten cities or city combinations. These indexes do not show whether it costs more or less to live in one city than in another and should not be used for such comparisons. Their function is to measure percentage

changes in retail prices—over a certain time in each city or city combination—of a fixed basket of goods and services representing the level of consumption of a particular group of families. Indexes which compare price levels among major Canadian cities are shown on p. 1053.

**World Retail Price Indexes.**—In order to place movements in Canadian retail prices into perspective, they should be compared with price changes occurring elsewhere in the world. This is done in Table 14, which indicates the percentage changes over the previous year in the consumer price index for each country specified. For purposes of comparison, countries are listed, alphabetically, by region. It should be noted that all percentages are rounded to the nearest whole number.

### Section 4.—Intercity Retail Price Differentials\*

As noted on p. 1051, the regional city price indexes given in Table 13 measure the *movements* of consumer prices *within each city* and cannot be used to compare levels of prices between cities. Indexes that do compare levels of prices among 11 major Canadian cities are given in Table 15. These indexes express prices in each city as a percentage of prices in Winnipeg as at May 1969, with Winnipeg prices at that date set equal to 100. The selection of Winnipeg as the base city has no special significance; the indexes may be expressed on the base of any of the individual cities included. The selected commodity groupings shown make up about three quarters of the average urban consumer budget, the most important omissions, for technical reasons, being shelter (rented and owned), fuel, light and water, and restaurant meals.

The retail prices from which the indexes were derived are largely those collected in each city for production of the consumer price index. Comparability between cities was achieved by matching, as far as possible, quotations for similar qualities of goods and services and types of retail outlets. Since prices compared include sales and excise taxes as applicable, variations between provinces in the scale of sales taxes imposed on a wide range of non-food commodities can be of significance in explaining intercity price differentials for these items.

#### 15.—Intercity Indexes of Retail Price Differentials for Selected Groupings of Commodities and Services, as at May 1969

<sup>1</sup> Excludes fuel and lighting.

### Section 5.—Consumer Expenditure

Household surveys of family expenditure provide information on consumer spending that can be related to family characteristics, such as geographical location, family size, income level, etc. A primary purpose of such surveys is to provide information for constructing, reviewing and revising the weights of consumer price indexes. Initially, the small-scale sample surveys carried out in Canadian urban centres since 1953 were designed to follow changes in the spending patterns of a well-defined group of middle-income urban families known as the target group of the consumer price index. However, in the years from 1953 to 1968, during which seven survey programs were conducted, a growing demand

\* A fuller explanation of the study from which these indexes were derived, including more details of the price comparisons, is given in the November 1969 issue of *Prices and Price Indexes*.

for expenditure statistics to serve other needs of government, business, welfare organizations and academic research resulted in a widening in the scope and size of the surveys in recent years, and in a decision to expand the 1969-70 survey programs to provide a large-scale national survey for the first time since 1948-49.

In general, the survey program has consisted of two phases—the collection by means of monthly record-keeping surveys throughout the reference year of detailed information on family food expenditures, and the collection of information by annual recall of all family expenditure, income and change in assets and liabilities. In three surveys (1959, 1964 and 1967) the monthly surveys were omitted and the annual recall surveys were enlarged in size and scope to refer to all families and individuals regardless of family type or income. The 1959 survey was designed to represent population in all urban centres of 15,000 or over, whereas the 1964 and 1967 surveys referred to 11 major regional cities.

The family expenditure survey program undertaken for 1969 was national in scope, with considerably larger samples than previously, designed to represent both urban and rural households in the 10 provinces, excluding the Yukon and Northwest Territories.\* In monthly surveys throughout 1969, approximately 10,000 families and individuals kept detailed records of expenditures on food and selected non-food items, including quantities acquired. Early in 1970, a different sample of households was interviewed concerning all family expenditures in the calendar year 1969. Usable family records were obtained from about 15,000 families and individuals.

Table 16 presents a summary of family expenditure patterns for families of two or more in the 10 provinces, classified by family income in 1969.

---

\* Results from the 1969 survey are being published in four volumes under the general title *Family Expenditure in Canada, 1969* (Catalogue Nos. 62-535 to 62-538 inclusive). Results from the 1969 food expenditure survey are available in two volumes entitled *Family Food Expenditure in Canada, 1969* (Catalogue Nos. 62-531 and 62-532). Earlier surveys have been published in occasional reports under the titles *Urban Family Expenditure* (1959, 1962, 1964 and 1967); *City Family Expenditure* (1953, 1955 and 1957); *Urban Family Food Expenditure* (1953, 1955, 1957 and 1962); and *Canadian Non-Farm Family Expenditures* (1947-48).

## Section 6.—Security Price Indexes

Security price indexes measure, through time, the effect of price change on the value of a portfolio of stocks bought and held by a hypothetical investor (as opposed to the more speculative trader). The portfolio represents stocks of Canadian companies listed on the Toronto, Montreal and Canadian stock exchanges. In the case of the mining index, eligible issues are for producing mines only. The number of shares held for each issue is in proportion to the total number of shares outstanding. Prices in the common stock indexes (investors and mining indexes) are Thursday's closing quotations each week, averaged over weeks. For the monthly preferred stock indexes, prices are monthly weighted averages of the daily closing prices in which weights are daily total sales. The indexes express current prices as a percentage of prices in 1961. Monthly and certain weekly indexes appear in the Statistics Canada monthly publication *Prices and Price Indexes* (Catalogue No. 62-002) and a weekly Statistics Canada report gives indexes on a weekly basis for all groups and subgroups.

The investors index is comprised of three major groups, with relative importance indicated by percentage weights as follows: industrials, 67.5; utilities, 18.6; and finance, 13.9. Each major group is further divided into industry subgroups corresponding to the standard industrial classification. The mining index is composed of two groups: base metals with a weight of 64.6 p.c. and golds with a weight of 35.4 p.c. The index of preferred stocks is not divided into component groups.

### 17.—Index Numbers of Common and Preferred Stocks, 1961-71

(1961=100)

*The interpretation of the symbols used in the tables throughout the Year Book will be found on p. vii of this volume.*

The subject of foreign trade covers more than the treatment of exports and imports of commodities, important though this is. In its broader sense, foreign trade is made up of the total international interchange of goods, services, securities and other financial transactions, all of which are presented in their appropriate relationship in this Chapter and in Section 5 of Chapter XXIII. Part I contains specially prepared information on the Canada-United States Automotive Products Agreement—its origin and objectives. Part II gives detailed statistics of total foreign trade. Part III outlines the various ways in which the Federal Government promotes and encourages trade relationships, and contains a brief review of the Canadian tariff structure. Part IV contains a review of the extent of travel between Canada and other countries in 1970, with estimates of the amount of money expended for that purpose.

## PART I.—THE CANADA-UNITED STATES AUTOMOTIVE PRODUCTS AGREEMENT\*

The Canada-United States Automotive Products Agreement was signed by the Prime Minister of Canada and the President of the United States at Johnson City, Texas, on Jan. 16, 1965. The Agreement set forth three objectives: (1) creation of a broad market for automotive products within which the full benefits of specialization and large-scale production can be achieved; (2) liberalization of United States and Canadian automotive trade in respect to tariff barriers and other impediments with a view to enabling the industries of both countries to participate on a fair and equitable basis in the expanding total market of the two countries; and (3) development of conditions in which market forces may operate effectively to attain the most economic pattern of investment, production and trade.

\* Prepared (December 1971) by W. M. MacLeod, Chief, Research and Analysis Section, External Trade Division, Statistics Canada.

Canada granted duty-free entry to specified motor vehicles and original equipment parts imported by Canadian manufacturers by Order in Council effective Jan. 18, 1965. The Automotive Products Trade Act of 1965, enacted by the United States Congress and approved on Oct. 21, 1965, authorized duty-free importation into the United States of certain Canadian motor vehicles and original equipment parts. The President proclaimed the entry into force of the tariff modifications retroactive to Jan. 18, 1965.

What factors led government authorities to fashion this agreement? What progress was made toward reaching the objectives announced? What was the position of the automobile industry in the Canadian economy? An examination of the Canadian industry and earlier tariff policies may disclose part of the answers to these questions.\*

### The Start of the Industry

The earliest Canadian-built motor vehicle was, probably, an electric car made in Toronto in 1893. The Ford Motor Company of Canada was formed in Windsor in 1904 by Canadian businessmen with exclusive rights to manufacture and sell Ford cars in all of the British Empire outside of the British Isles, but production at first was confined to assembling bodies and wheels on chassis imported from Detroit. The McLaughlin Motor Car Company was created in Oshawa in 1907 to use the Buick engine in the McLaughlin car designed by the McLaughlin brothers. In 1915 the company acquired Canadian rights to the Chevrolet, and in 1918 the two McLaughlin companies were merged into General Motors of Canada. Studebaker entered the Canadian market in 1910 with the acquisition of an assembly plant at Windsor operated by the Everett-Metzer-Flanders Company. By 1910, eight plants with 2,400 employees were manufacturing automobiles in Canada.

### Tariff History Before 1960

Early automobile imports to Canada faced the same 35-p.c. tariff as carriage imports. Although Canada had neither an established industry nor a large potential domestic market, protection granted the industry fell short of that given in the United States and in Europe. In 1915 the typical automobile tariff was the 45-p.c. rate of United States and of France. Britain, although separated by an ocean from the United States, imposed a tax of 33½ p.c.

The tariff stood at 35 p.c. until 1926, when political pressure for free imports brought a drop to 20 p.c. for cars valued up to \$1,200, and to 27 p.c. for cars valued over \$1,200. Difficulties encountered by the industry about this time led to several tariff adjustments. They included a system of home consumption drawbacks where the Canadian manufacturer had a 50-p.c. Empire content in his factory output.

In 1931 the tariff was altered to a 30-p.c. duty on cars valued between \$1,200 and \$2,100, and 40-p.c. on cars valued over \$2,100. Further, maximum discount on cars for duty purposes was limited to 20 p.c. of list prices. In 1936, after a few months of a schedule based on value, a 17½-p.c. rate was set, with provision for raising it to 22½ p.c. when it could be established that imports materially affected domestic production. In addition, the arbitrary basis for duty valuation was dropped and a 3-p.c. import tax substituted.

Free importation of parts not capable of economic manufacture in Canada was allowed; however, a tariff providing reasonable protection applied when substantial employment under relatively economic production seemed possible. Tariff revisions in 1936 consolidated automotive parts into several specific tariff items (primarily items 438-b, c, d and e)

\* For further discussion, see Carl E. Beigie, *The Canada-U.S. Automotive Agreement: an Evaluation*, Montreal, 1970; H. E. English, *The Canadian Banker*, Summer 1965; Harry G. Johnson, *Canadian Journal of Economics and Political Science (CJEPS)*, May 1963 and *The Business Quarterly*, Spring 1964; Kathryn A. Morisse, *Federal Reserve Bulletin*, November 1969; Paul Wonnacott, *CJEPS*, February 1965; Paul and R. J. Wonnacott, *CJEPS*, May 1967; Sun Life Assurance Company, *The Canadian Automotive Industry*, September 1959; United States Senate Committee on Finance, *Annual Report of the President to the Congress on the Operations of the Automotive Products Trade Act of 1965*, Mar. 1967, May 1968, July 1969, November 1970; United States House of Representatives, *Message from the President of the United States Transmitting a Special Report on the Joint Comprehensive Review of the United States-Canada Automotive Products Agreement* (Doc. No. 379), Sept. 4, 1968.

and permitted dropping the old home-consumption drawbacks. The Empire content requirements were revised to permit duty-free importation of a broad list of automotive parts, provided: (1) parts concerned were of a class or kind not made in Canada; (2) manufacturers met Empire content equal to 40 p.c. of factory cost of automobile output (excluding duties and taxes) if factory production was less than 10,000 cars; 50 p.c. for production between 10,000 and 20,000; and 60 p.c. for production over 20,000. Truck manufacturers received the same privileges, with maximum Empire content set at 50 p.c. with output over 10,000 vehicles.

The principle that "volume was the key to the amount of Canadian manufacture that could be undertaken economically" was established in the 1936 revisions. Two years later the Empire content of factories producing over 20,000 cars was set at 65 p.c.; this held until civilian production of cars stopped in 1942. Maximum requirements went back to 60 p.c. four years later. At the same time, some of the technical factors in calculating content were adjusted in line with changes in Canadian and American costs that had taken place.

The secondary tariff protection given automotive parts manufacturing through Empire (Commonwealth) content provisions was considered vital to developing parts fabrication in the domestic industry. The customs tariff, including Empire content requirements and tariff preferences in Empire markets, helped develop the Canadian automotive parts industry. The content revisions in 1936 stimulated the manufacturing of additional automotive parts in Canada. In order to make the 60-p.c. content, manufacturers awarded contracts in Canada. Furthermore, Canadian subsidiaries of American firms found it easier to raise expansion capital and in some instances displaced former American sources of supply.

### **Production, Imports and Exports in the Early Years**

Table 1, giving aggregate figures of production, imports and exports of motor vehicles from 1904 through 1964, shows the early development of car and truck production followed by the expansion of the 1920s in production, in exports reflecting tariff advantages for Canadian vehicles over American vehicles in Empire countries, and in imports following the reduction of tariffs. The figures show the severe contraction of the depression years in production with the industry operating in 1932 at about 15-p.c. capacity, in exports facing depressed markets, fluctuating exchange rates and arbitrary customs valuations, and in imports met by a change in the basis of duty valuation noted earlier which increased effective protection against United States imports. Although production recovered in the late 1930s and exports comprised one third of automobile production and two fifths of commercial vehicle production, the lower level of tariff protection forced smaller manufacturers like Studebaker, Hudson and Packard to withdraw from Canada and closed down car manufacturers like Graham-Paige, Willys-Overland, Durant Motors, Dominion Motors and Hupp Motor Car as well as truck builders like Thornycroft, Leyland Motors and Federal Truck. Conversion of the industry to producing military vehicles took place as motorized equipment was demanded for Commonwealth forces.

In the decade following the War, production expanded with peacetime requirements. Early postwar car output was confined to General Motors, Ford and Chrysler; however, Studebaker started assembly work by 1947. Exports in this period rose at first with the shortage of vehicles at the end of the War, but lack of foreign exchange and rebuilding of British and European automobile industries made the early surge temporary. Imports made up a high percentage of the Canadian market in the early postwar years. Imports of British vehicles displaced American imports, which fell from 85 p.c. of foreign supply in 1947 to under 4 p.c. in 1950. However, medium- and high-priced American car imports increased sharply in the next five years and accounted for over one half of car imports in 1955; West German Volkswagens were introduced in this period. The record for the five-year period ended with 1960 shows a drop in production, a sharp fall in exports approximating the experience of the depression years, and a great surge in imports.

<sup>1</sup> Change from 1936-40 to 1946-50.**Position of the Industry in 1955**

By 1955, the Canadian automotive industry comprised three major automobile and truck manufacturers, three independent automobile manufacturers (one also producing trucks), one large independent truck manufacturer, a number of small bus and specialty truck manufacturers, and some 400 firms fabricating automotive parts and supplying automotive products. It included as well manufacturers' dealers. Other parts of the industry were importing and servicing motor vehicles. About 20 p.c. of retail sales was related to purchase or use of motor vehicles. The ratio of exports to imports for automotive products was affected by the fact that "United States firms, instead of exporting cars to Canada as they once did, have simply located their parts and assembly plants there". Only about 5 p.c. of the industry was Canadian-controlled in 1955.

With total exports of goods and services amounting to some 21 p.c. and imports to some 23 p.c. of the gross national product in 1955, and with most manufacturing industries being heavy net importers, Canadian public policy recognized the importance of developing the industry in Canada and stimulating export trade and import substitution of automotive products. The automotive industry study that was prepared for the Royal Commission on Canada's Economic Prospects (the Gordon Commission) noted the identification problem for the parts industry. Official coverage was limited to firms producing metallic automotive parts; however, firms producing automotive castings and forgings were classified elsewhere. Again, some captive industry facilities were classified under vehicle manufacturers rather

than parts. The study estimated the output of the broader list of automotive supplies in 1953 at some \$526,000,000, allowing for metallic parts production by other firms and output of such major non-metallic items as tires and tubes (\$120,000,000), glass and brake linings.

### The Bladen Plan

Amendments to the Tariff Act of 1936 established a basic rate of 17½ p.c. on vehicles and on parts; however, engines and automatic transmissions were subject to a rate of 25 p.c. For a long list of products generally used in the *parts* industry, entry was free where the item was of a class or kind not made in Canada. If the rate was 17½ p.c. and if half of the parts comprised duty-free imports, the degree of protection to Canadian content was 35 p.c. Again, for a long list of items generally used in *vehicle* manufacturing entry was free, provided: (1) the item was of a class or kind not made in Canada, and (2) a minimum proportion of the factory cost of production took place in the Commonwealth (in effect, Canada). This increased vehicle production protection above the 17½-p.c. tariff rate to a degree depending on the proportion of cost that could be imported duty-free. This system of protection promoted economic inefficiency where the car maker produced or bought in Canada some components at excess cost, and other components that could be produced at a moderate excess cost were not produced because the industry was encouraged to produce parts not eligible for conditional free entry or where the tariff rate was below the standard 17½ p.c.

The export surplus in motor vehicle trade that Canada enjoyed in the period before World War II shifted after the War to an import surplus. The answer to the problem of creating an efficient and competitive Canadian industry was considered to be the enlargement of the market to use economies of large-scale production—economies of specialization by re-allocation of the product mix, and economies of scale by lowering average costs of particular products. The idea of integration on a continental scale covered both types of economies.

Dean Bladen recommended in his Royal Commission on the *Automotive Industry Report 1961* an "extended content" plan designed to lead to further integration of the industry. The Commissioner proposed that *all* motor vehicles and parts be admitted free of duty where the content requirements were met, and that exports of parts be included in the calculation of Canadian content.

One critic maintained that the protective effect of the tariff was not measured solely by the extent to which the domestic price of the finished product to consumers rose over the world market price; remission of duties on imported inputs in exchange for increased exports of domestic products was really an increase in protection to domestic producers at the expense of domestic consumers and taxpayers.

Dean Bladen's unimplemented extended-content plan would have worked toward lower-cost Canadian production by abolishing duties on specific parts (those dutiable even on fulfilment of content requirements). By allowing producers to count exports as Canadian production, it would have replaced high-cost Canadian production with lower-cost Canadian production. Although motor vehicle manufacturers both buy parts and sell vehicles and the subsidy would be paid to a different division of the company from the one actually buying the parts, the plan was criticized as implicitly subsidizing exports of parts. With a 60-p.c. content requirement and a 17½-p.c. tariff, the export subsidy would have been 29½ p.c.

### Automobile Tariffs of 1962 and 1963

Changes in tariffs on automobiles and parts introduced in late 1962 and 1963 brought export incentives into force. The October 1962 change was the announcement that the 25-p.c. most-favoured-nation tariff (applying to the United States, Continental Europe and Japan) on automatic transmissions—which had been suspended—would be reinstated but recovery of the 25-p.c. duty on transmissions and engine blocks (up to 10,000 per manufacturer) could be earned by the excess of Canadian content of parts exported over exports in the year ended Oct. 31, 1962. The October 1963 change went beyond the engine and transmission plan by allowing recovery of duties on all imports of vehicles and original

equipment parts where the Canadian content of exports of vehicles and parts exceeded exports in the year ended Oct. 31, 1962. This applied only to companies with major Canadian assembly plants.

The new policy adopted by the Federal Government in 1962 and extended in 1963 differed from the Bladen Plan. While the 1962 tariff followed the Bladen Report by providing subsidies for parts exported only and also stipulated remission of duty only on automatic transmissions and engines, the 1963 tariff extended the subsidy to both parts and vehicles exported and allowed duty remission on all original equipment parts and motor vehicles. Again, the Bladen Plan for changing the existing system of content protection with more volume steps, and average content requirements increasing with production at a diminishing rate, was not followed, but arrangements for subsidizing additional exports by remission of duties was added to the existing system. While the car manufacturer could lower costs by getting duty remission on parts imported and re-allocating parts made or bought in Canada, he could not use the export of a low-cost part on a large scale to satisfy content, and import other parts duty-free as under the Bladen Plan. But the manufacturer might export parts beyond the value of dutiable parts imported and use the credit to import parts duty-free and, in this way, obtain the help offered by the Bladen Plan. Further, where the Bladen Plan would have subsidized parts purchased by non-resident sellers in Canada, the new policy was confined to established (American) producers.

### Features of the 1965 Automotive Agreement

The Bladen recommendations and the changes in the automobile tariff introduced in 1962 and 1963 raised issues of great complexity and much of the economic analysis was confined to the odd allocation effects of those policies and the scope for increased protection. The 1965 Agreement appeared to be freer of such implications. The objectives of the 1963 policy were: (1) to increase production and create new employment in Canada; (2) to improve Canada's balance of payments; and (3) to give producers of parts and vehicles an incentive to achieve longer production runs and a greater degree of specialization. However, the policy moves of 1962 and 1963 were interpreted in some areas as export bounties, proscribed in the General Agreement on Tariffs and Trade. Some American parts manufacturers forced an investigation by the Treasury Department which would have led to countervailing duties had the enquiry found the duty-remission policy was an export bounty in American law.

The President of the United States in a letter to the President of the Senate and the Speaker of the House of Representatives clarified this view of the origin of the agreement:

The automotive producers of the United States and Canada make up a single great North American industry. The same kinds of cars, using the same parts, are produced on both sides of the border, in many instances in factories only a few miles apart. Over 90% of the automobiles sold in Canada are assembled by firms owned in part or in whole by United States companies. The men and women who work in the plants on both sides of the border are members of the same international union.

Tariffs and other restrictions involving Canada-United States trade in automotive products have been the cause of significant inefficiency in this great industry. Canadian plants produce a great variety of cars, essentially identical with those made in far larger numbers in the United States. Because the Canadian market is relatively small, production runs have been short, and costs and prices have been high. High costs and prices, in turn—supported by the tariff and other restrictions—have contributed to keeping the market small.

Historically, Canada's share in North American automotive production has lagged far behind her share in automotive purchases. In 1963, in an attempt to increase its share of the North American market, the Canadian government put into effect a plan, involving the remission of tariffs, which was designed to stimulate automotive exports. A number of United States manufacturers, believing they would be injured by the plan, called upon this Government to impose countervailing duties. In all probability, such action would have invited retaliation. We were faced by the prospect of wasteful contest of stroke and counter stroke, harmful to both Canada and the United States, and helpful to neither. Our broader good relations with our Canadian friends would have suffered serious strain.

To avoid such a dismal outcome, our two governments bent every effort to find a rational solution to the problem of the divided industry. The Automotive Products Agreement that the Prime Minister and I signed in January is the result of our joint labors.

The agreement will benefit both countries. We will have avoided a serious commercial conflict. Canada will have achieved her objective of increasing her automotive production. United States manufacturers will be able to plan their production to make most efficient use of their plants, whether in Canada or the United States. They will save the price of the tariff, and, over the longer run, we will benefit from the faster growth in the Canadian market which lower prices will make possible.

The Agreement enabled anyone in the United States to import cars and original equipment parts free of duty from Canada. This eliminated an American duty of  $6\frac{1}{2}$  p.c. on cars and  $8\frac{1}{2}$  p.c. on parts and trucks. The Canadian Government eliminated tariffs on similar products but only on imports by qualified automobile manufacturers. (Individuals in Canada who import new automobiles from the United States are assessed 15 p.c. duty.) This meant dropping a tariff of  $17\frac{1}{2}$  p.c. on cars and of  $17\frac{1}{2}$  p.c. to 25 p.c. on most parts. Duty-free entry did not apply in either country to various "special purpose" vehicles, to replacement parts, or to tires and tubes not mounted on new cars. Canada extended duty-free privileges to all countries but the United States confined the privilege to Canada alone.

Both countries attached content restrictions. Under Annex B of the Agreement the United States required that 50 p.c. of the value of all parts and, after 1968, 50 p.c. of the value of cars imported from Canada must be of North American content. Until 1968, the 50 p.c. applied only to chassis while 40 p.c. of the rest of the value of the complete car must be of North American content. Thus, overseas producers wishing to establish production facilities in Canada had to go beyond assembling cars.

Under Article II (a) and Annex A of the Agreement, Canada gave duty-free entry to qualified manufacturers who were required to maintain at least the same ratio of their production of vehicles in Canada to their sales in Canada as in the model year 1964 or not, in any event, less than 75 p.c., and also maintain in automotive production a Canadian value added at least equal to that attained in vehicles of the same class in model year 1964 (ended July 31, 1964). The term "Canadian value added" denotes the value of Canadian materials, services, labour and capital. It is about equivalent to manufacturer's selling price less the cost of imported materials and parts.

In arrangements with the Government of Canada, separate from and without legal effect on the Agreement, Canadian vehicle manufacturers in 1965 undertook, in addition, to increase by the 1968 model year, which ended July 31, 1968, the dollar value of Canadian value added in vehicles and original parts by \$260,000,000 (pro-rated among the companies) over that achieved in the model year 1964. The larger commitments included in the \$260,000,000 were: General Motors, \$122,000,000; Ford, \$74,200,000; Chrysler, \$33,200,000; and American Motors, \$11,200,000. They also agreed to increase year-by-year Canadian value added by an amount equal to 60 p.c. of the growth of automobile sales in the Canadian market (50 p.c. in the case of commercial vehicles). These special provisions were made to safeguard the smaller Canadian industry, to ease it through the adjustment period, and to bring into line the Canadian share of North American production with the Canadian share of the North American market.

The ratio of production to sales condition permitted specialization based on tariff-free exchange, allowing Canada to concentrate on few models, working with a longer production run of these models for export, and importing other models dropped from Canadian production. Gains in efficiency from economies of scale might be expected. The second condition of the Agreement gave some protection for Canadian manufacture of parts. While the first condition allowed a rapid specialization in Canadian assembly of cars, the second condition confined specialization in parts to Canadian parts going into Canadian-produced cars. Specialization within parts, such as batteries, could follow from greater-volume orders. In the view of some economists, these two conditions, by permitting specialization and imposing no further quantity restraints than existed under the pre-1962 tariffs, were acceptable from a free-trade viewpoint.

With respect to the letters of undertaking, the 60-p.c. Canadian content provision imposed no further restraint than under the pre-1962 tariffs. While the \$260,000,000-undertaking, less than 20 p.c. of Canadian automotive production in 1964, might increase

excess costs (the excess cost of producing in Canada over cost of importing duty-free), costs could drop by duty-free exchange and specialization allowed.

The United States Department of Commerce estimated in 1965 that the United States automotive export surplus with Canada could be maintained at the \$500,000,000 (U.S.) level existing prior to the Agreement if North American automotive vehicle sales in Canada increased at an annual rate of 8 p.c.—a rate consistent with the high Canadian growth rates prevailing during the previous five years. The rate of growth of the Canadian market, the share held by third countries, and changes in net exports from Canadian automotive producers to third countries affect the net automotive trade position of Canada with the United States. American concern has been expressed that the growth in North American vehicle sales at the forecast rate did not materialize.

Article IV of the Agreement stipulated that, not later than Jan. 1, 1968, the two Governments should jointly undertake a comprehensive review of the progress made toward achieving the objectives set forth. During this review, the Governments should consider further steps for the full achievement of these objectives. Article VII specified that the Agreement should be of unlimited duration; however, each Government could terminate the Agreement on a year's notice to the other Government.

### Trade, Production, Employment, Prices and Investment, 1964 to 1970

Exchange of automotive products between Canada and the United States expanded rapidly with the removal of trade barriers and reorganization of production facilities under the Agreement. Total two-way trade soared from \$796,000,000 in 1964 to \$6,946,000,000 in 1969, levelling off in 1970 at \$6,560,000,000 with the economic slowdown and severe General Motors strike. The balance of automotive trade moved from a deficit of \$602,000,000 in 1964 to some \$75,600,000 in 1969 (and in the special circumstances of 1970 swung from a deficit to a surplus.) This reflected a turn-around from a small deficit in trade in finished vehicles to a substantial surplus counteracting an increasing Canadian deficit with the United States in the exchange of parts and accessories.

Expansion of automotive exports southbound from 1964 to 1970 accounted for about 52 p.c. of the gain in total domestic exports to the United States. The increase in automotive imports from the United States accounted for 52 p.c. of the rise in imports from that country. On the other hand, automotive exports to and automotive imports from the rest of the world represented some 8 p.c. of the increase in Canadian domestic exports outside the United States market and about 14 p.c. of the increase in value of imported supplies from other countries.

Production gains also have been noteworthy; the volume of Canadian motor vehicle output rose from 671,000 units in 1964 to top the 1,000,000-mark in 1968 at 1,180,000 units, and reached a high of 1,353,000 units in 1969. The increase in production was highest in 1965 and 1968 when the stimulus of the Agreement coincided with strong demand. Canadian producers exported output of particular lines to the United States, and replaced production of other lines with imports. Table 3 shows vehicle sales of North American make failed to keep pace with output; sales of overseas make, however, in the latest four years grew at a faster rate than Canadian output.

Employment increased by some 31 p.c. to average over 90,000 in 1969 but dropped off in 1970. Cited productivity gains in the automotive industry helped narrow the gap between Canadian and United States performance, and had a far-reaching impact on the Canadian economy. Wage rates also advanced. Wages in assembly operations had been about 23 p.c. below the level in United States plants in 1964 but were only some 8 p.c. lower in 1970. The major automobile producers signed agreements in 1968 granting their workers nominal parity with United States workers by June 1, 1970.

Resulting in part from rising productivity, the wholesale price differential for cars sold in the United States and Canada decreased. The spread on the same four-door, six-cylinder car, measured at factory wholesale prices, was 9.6 p.c. in the model year 1964 and 3.9 p.c. in the model year 1970. Changes in domestic sales taxes worked in the other direction. The

Canadian federal sales tax was raised from 11 p.c. to 12 p.c. in 1968 while the United States excise tax was reduced from 10 p.c. to 7 p.c. in 1965 and eliminated on Aug. 15, 1971. Thus, the suggested retail price spread in 1970, at 7.2 p.c., was only some 2.7 percentage points below the 1964 spread versus the 5.7 percentage point drop in the factory list price.

Since 1964 the industry has recorded an average yearly outlay of \$166,000,000 on new fixed-capital formation. The major motor vehicle producers also make large purchases from a wide range of ancillary industries that provide such items as machinery, tires and tubes, paints and chemicals, and metals.

The multiplicity of uses to which external trade statistics can be put demands careful attention to the classification adopted and the degree of commodity detail required. A commodity classification is required to facilitate analysis of trade in terms of the country's economic problems, in sufficient detail to satisfy industrial and commercial needs, conveniently related to available statistics of other countries and, in particular, to domestic production, consumption and inventory statistics and in detail usable alongside tariff statistics. However, the statistician or customs officer must calculate a trade-off between statistical demand and supply. Regard must be paid to the problem that traders and their agents have in providing very detailed commodity descriptions, a decided irritant when consignments are mixed. Inevitably, serious statistical problems have arisen in compiling United States and Canadian automotive trade figures. Because import figures of vehicles and original equipment parts are identified by tariff item in both countries, a joint sub-group examining the problem concluded that the most comprehensive measure of total automotive trade would be the import statistics of the two countries. Table 2 covers vehicles and parts as defined in division 58 of the Canadian export and import commodity classifications, and other parts and accessories as identified in Canadian and American tariff classifications.

## Conclusion

The joint comprehensive review of the Agreement began at a meeting in Washington on Dec. 13, 1967. A joint working party was established and meetings were held in Ottawa and Washington over several months. Following a delay, occasioned by the Canadian national election of June 1968 and appointment of new Ministers to several federal departments directly concerned, and further discussion in August 1968, the Joint Review ended. Both Governments concluded that considerable progress had been made toward achieving benefits of broader automotive trade in automotive products. Trade had expanded and production cost economies had been realized with rationalization of production in both countries and especially in Canada. Trade and manufacture of products in related fields had grown and car price differentials had narrowed. Employment in automotive production had increased in both countries and the few dislocations occurring had been dealt with through separate adjustment assistance programs. Although not enough experience had been accumulated under the Agreement to recommend changes, areas of possible improvement had been studied: (1) liberalization of conditions on duty-free entry into Canada; (2) possible amendment of the Agreement to encompass additional products; (3) simplification of customs and other administrative practices; and (4) improvement and reconciliation of trade statistics.

The Governments of the United States and Canada were unable to agree on the specific conditions under which the transitional safeguards on free entry into Canada would be eliminated. Canadian concern with the viability of the smaller Canadian industry, complicated by the subsidiary-parent relationship, has not relaxed to date (December 1971).

United States officials recognized in the Joint Review discussions of product coverage that inventory and identification complications resulted from exclusion of replacement or service parts identical with original equipment parts; however, extension of the Agreement seemed to them to add further administrative and inventory difficulties. The broad market and production integration objectives appeared to rule out special-purpose vehicles on a small scale designed to perform limited objectives. However, snowmobiles and original parts were accorded duty-free entry into the United States as a result of the pact; Canada provided reciprocal duty-free entry retroactive to Nov. 1, 1966. Little interest was expressed by United States officials in extension of the Agreement to tires and tubes not mounted on a vehicle or to dies, jigs, tools, fixtures, etc., which had non-automotive applications. Some steps toward simplification and facilitation of customs administration were noted but no substantial changes were expected. The problem of trade statistics has been noted earlier.

From either a national or a continental viewpoint the impressive result of the Automotive Agreement of 1965 was a gain in welfare, in the loose sense of denoting economic efficiency. Determination of the effect of the Agreement on the distribution of income within and between the two countries would be a complex project. The gain for Canada has been resources devoted to improvement in allocative efficiency and the lead provided by the industry to faster economic growth.

## PART II.—FOREIGN TRADE STATISTICS\*

### Section 1.—Explanatory Notes on Canadian Trade Statistics

**Sources.**—Canadian foreign trade statistics are compiled from information recorded on customs documents received by Statistics Canada from the various customs ports in Canada, supplemented with energy data obtained through other channels. It should be noted that trade figures reflect the physical movements of goods across Canada's national and customs boundaries but do not always represent the financial transactions for changes in ownership of these goods.

**Coverage.**—Total Canadian exports are the sum of domestic exports and re-exports. Domestic exports or exports of Canadian produce include shipments abroad of goods wholly produced in Canada together with exports of previously imported goods which have been changed in form by further processing in Canada. Re-exports or exports of foreign produce include only goods previously included in import statistics which are exported from Canada in the same form as when imported. Minor operations such as cleaning, sorting or re-packing are not considered as changing the condition of imported goods. Following the introduction in January 1964 of the "General Trade" system of compilation, re-exports have also included outward movements of goods previously imported but stored in customs warehouses.

Likewise, imports, as from January 1964, include all goods cleared by customs immediately on arrival in Canada together with goods that are entered into customs warehouses. For earlier years, imports under the "Special Trade" system of presentation included goods cleared immediately on arrival plus goods cleared for consumption out of customs warehouses. This meant that those goods, which crossed the national boundary into and out of customs warehouses without crossing the customs boundary, were excluded.

Certain commodities have, since January 1960, been excluded from both export and import trade statistics but have been published monthly under "Special Transactions—

\* Prepared in the External Trade Division, Statistics Canada.

Non-trade". This category includes commodity movements which either have no international financial implications or are better considered as non-merchandise transactions in the statistics of Canada's balance of international payments. These are: unrefined gold, gold products where the gold content is 80 p.c. or more of the total value, and gold coin, except collections; settlers' effects; private donations and gifts; tourist purchases; goods shipped back and forth across the national boundary by the diplomatic and military personnel of Canada and of foreign countries posted abroad and in Canada, respectively; temporary movements for exhibition or competition, including films for processing; bunker supplies and stores sold to foreign vessels or aircraft in Canadian ports or purchased by Canadian carriers abroad; military grants to NATO member countries; ships of British construction and registry imported for use in Canada, and ships purchased for use as international carriers but not used to carry goods between points in Canada; and generally, all temporary exports and imports and goods merely moving in transit through Canadian territory.

The series "New Gold Production Available for Export", which has been published as a supplement to external trade statistics, is deleted. Being an item of non-merchandise transactions in the current account, it is described in Chap. XXIII, Sect. 5, on the Canadian balance of international payments.

**Valuation.**—The basic source documents require the reporting of exports at transaction values, f.o.b. place of lading (i.e., exclusive of inland freight, insurance, handling and other charges). Declarations denominated in foreign currency are converted to Canadian dollars for publication. The value of goods imported is usually that as determined for customs duty, and the Canadian Customs Act generally requires the valuation of goods f.o.b. point of shipment in the country of provenance. However, continuing effort is made to prevent the inadvertent filtering through during document processing of c.i.f. values, in particular for free goods or goods subject to specific rates of duty.

**Classification.**—Beginning with statistics for January 1961, a new export commodity classification was used, based on the Standard Commodity Classification developed by Statistics Canada as a tool for integrating statistical series derived from different sources. Whereas the classification previously used classified commodities primarily according to the material of which they were chiefly composed, the new classification places commodities in sections mainly according to stage of processing and purpose, as follows: Live Animals; Food, Feed, Beverages and Tobacco; Crude Materials, Inedible; Fabricated Materials, Inedible; End Products, Inedible; and Special Transactions—Trade. For most of the commodities of major importance in Canadian exports, the classes of the new commodity classification are substantially identical with those of its predecessor.

As from January 1964, a new commodity classification was also introduced for import statistics, based on concepts similar to those embodied in the export commodity classification, so that there has been a closer correspondence between the two sets of statistics. The import commodity classification is more extensive than the export commodity classification and in its new form gives a comprehensive coverage of those commodities which constitute the bulk of Canada's import trade. The grouping system employed in the new classification also makes easier the identification of other commodities which may merit separate specification; continuing study is being made to keep the classification both meaningful and up to date in the dynamic environment in which commodities entering international trade are becoming more sophisticated and complex.

Trade is credited to countries on the basis of consignment. For exports from Canada, the country of consignment is that country to which goods are, at the time of export, intended to pass without interruption of transit except in the course of transfer from one means of conveyance to another. For imports into Canada, the country of consignment is the country from which the goods came without interruption of transit except in the course of transfer from one means of conveyance to another. This is not necessarily the country of actual origin, since goods produced in one country may be imported by a firm in another

country and re-sold to Canada; in such cases the second country is the country of consignment to which the goods are credited. There is one exception to this rule; an attempt is made to classify by country of origin goods produced in South America, Central America, Bermuda and the Antilles and consigned to Canada from the United States. The effect of this procedure is to reduce slightly the imports credited to the United States and to increase those credited to South and Central American countries.

The country sub-totals include trade with Commonwealth and other countries (the Republic of Ireland and the Republic of South Africa) entitled to Preferential rates of duty. Trade with Alaska and Hawaii is included in the United States statistics in all the relevant tables of this Chapter, even though these two areas were separately classified prior to January 1959 and January 1960, respectively.

**Discrepancies in Trade Statistics Between Canada and Other Countries.**—Canada's statistics of exports are rarely in exact agreement with the import statistics of its customers and parallel differences occur with Canadian imports. Major factors contributing to these discrepancies include:—

- (1) Differences in the system of valuation used by Canada and those of other countries, with respect to the treatment of transportation charges, fair market and transaction values.
- (2) Differences in the statistical treatment of special categories of trade, such as military supplies, government-financed gifts of commodities, postal and express shipments, tourist purchases, bunkers and warehouse trade.
- (3) Differing definitions of territorial areas.
- (4) Differing systems of crediting trade by countries, notably the consignment system used by Canada and the actual origin or ultimate destination system in use in some other countries.
- (5) Differences in the time at which trade is recorded in the statistics of partner countries caused by the time required for goods to move from one country to another.

## Section 2.—Total Foreign Trade

In considering the figures in Sections 2 to 5, it should be noted that exports and imports of gold are excluded from among other commodities in all tables. There are, in the main, three sets of tariff rates in operation in Canada: British Preferential, Most-Favoured-Nation and General Tariff as described at pp. 1105-1106. Generally, the Canadian tariff imposes duties on a greater proportion of manufactured goods than of raw or semi-processed products.

### 1.—Value of Total Foreign Trade of Canada, 1956-70

NOTE.—An adjustment has been made for "Special Transactions—Non-trade" to present figures on "general trade system" throughout.

There are currently about 35,000 bowling alleys in Japan and one third of them are floored with maple bedstock that came fully machined from Canada. Canadian manufacturers also do a lucrative business with Japan in bowling alley pins, which require replacement every nine to twelve months.

**Section 4.—Trade by Commodity**

This Section provides detailed information on the composition of Canada's exports and imports for 1969 and 1970. Table 7 shows exports and re-exports to and imports from all countries, the United Kingdom, the United States, Japan, the European Economic Community and other countries, classified by commodity section; Table 8 gives detailed statistics of all commodities of any importance exported from Canada to all countries, to the United Kingdom and to the United States; and detailed statistics for imports into Canada by section and commodity appear in Table 9.

**7.—Exports to and Imports from Principal Countries and Areas, by Section, 1969 and 1970**

*The movement of hundreds of Canadian Hereford cattle to Japan by air in the summer of 1971 demonstrated that prime breeding stock can be moved in first-class condition and at reasonable cost by this means. Giant Hercules military-type transports were used for this purpose.*

## Section 5.—Trade by Section and by Stage of Fabrication

Tables 10 and 11 present historical series of Canada's external trade for the period 1950-70 by section and by stage of fabrication with a view to throwing light on the changes in the anatomy of Canada's international trade. The estimates for the years prior to 1958 are subject to some limitations because of the introduction of the revised commodity trade classifications in the early 1960s.

**Methodology.**—To allocate exports and imports into the statistical framework based on stage of fabrication, viz., crude materials, fabricated materials and end products, requires a secondary classification of the commodities in certain sections of the Standard Commodity Classification (SCC). Live Animals (Section I), being a natural product, are considered as crude materials. Section II (Food, Feed, Beverages and Tobacco) is distributed as follows: crude materials include natural products not processed beyond cleaning or preparation for shipment, such as fresh fruits and vegetables, raw sugar, etc.; fabricated materials include commercial feed stocks and commodities which are further processed rather than used for direct consumption; and end products comprise prepared pet feeds and commodities which require no further processing but are used directly for consumption, such as cheese, canned foods, whisky, cigars and cigarettes. Sections III, IV and V are as they are defined in the SCC. Thus, Section V (Inedible End Products) consists of articles rather than materials, that is to say, finished commodities which have attained their final degree of processing together with specific parts and accessories of machinery which are classified with the machinery. Section VI (Special Trade Transactions), which contains comparatively few classes, has been distributed on the basis of special studies.

**Exports.**—Canada's exports followed a generally upward trend during the two decades from 1950, with a steady increase from 1954. The value of domestic exports advanced more than five times up to the end of 1970 to \$16,473,900,000, with the major sections showing varying rates of change. This growth was reflected in all sections except Live Animals where exports in 1970 were about four fifths of the value in 1950. Exports of Food, Feed, Beverages and Tobacco more than doubled to \$1,800,300,000; Inedible Crude Materials were up roughly nine times to \$3,068,200,000; Inedible Fabricated Materials more than tripled to \$5,866,500,000; and Inedible End Products, where the growth rate was most pronounced, were over 20 times higher at \$5,639,600,000. In 1970, domestic exports were 14 p.c. above those in 1969, Inedible Fabricated Materials rose 14 p.c. and Inedible End Products continued their upward trend by rising 5 p.c. The largest relative growth was recorded in Food, Feed, Beverages and Tobacco at 28 p.c., followed by a gain in Inedible Crude Materials of 25 p.c. The magnitude of the changes was substantial, following declines in 1969.

Analysis by stage of fabrication shows that 1970 exports of crude materials at \$4,307,600,000 were four and a half times those of 1950. Over the same period, exports of fabricated materials more than tripled to \$6,083,400,000, and end products were up 14 times to \$6,082,800,000. After a decline of 6 p.c. in 1969, exports of crude materials increased by 30 p.c. in 1970. Shipments of fabricated materials and end products showed increases of 14 p.c. and 4 p.c., respectively.

Over the 1950-70 period, the importance of end products in Canada's exports gained relatively to crude and fabricated materials. The relative contribution of crude materials to domestic exports declined from 30 p.c. to 26 p.c., and that of fabricated materials from 56 p.c. to 37 p.c. On the other hand, the share of end products increased from 14 p.c. to 37 p.c. Newsprint maintained its predominant place among fabricated materials, while commodities ranging from automotive products and aircraft to wearing apparel contributed to the rising importance of end products.

The key importance of the United States among Canada's export destinations was enhanced, as the proportion of exports going to that market increased from an average of 60 p.c. in the early 1950s to an average of 68 p.c. in 1968-70. The proportion of domestic exports of crude materials and fabricated materials going to that country declined from 53 p.c. and 77 p.c., to 44 p.c. and 60 p.c., respectively, in 1970, whereas that of end products rose from approximately 42 p.c. to 84 p.c. The United Kingdom's share of Canadian domestic exports declined from 15 p.c. to about 9 p.c. in the same comparison but the representation of end products in that share was only slightly lower in 1970.

**Imports.**—Imports advanced four and a half times in the 1950-70 period to reach \$13,939,800,000. Between 1960 and 1970, however, imports rose 154 p.c. against an increase of 213 p.c. in exports. Thus, while expanding imports reflected the increasing industrial growth and prosperity of Canadians during the 1960s, the rise in exports was larger in response to vigorous demand for Canadian commodities abroad. During the whole period, imports of Food, Feed, Beverages and Tobacco nearly tripled to \$1,085,100,000, Inedible Crude Materials rose 57 p.c. to \$1,171,800,000, Inedible Fabricated Materials increased three and a half times to \$2,885,400,000, and Inedible End Products increased nearly eightfold to \$8,605,600,000. Imports of Live Animals, which fluctuate from year to year, reached a high level of \$30,450,000 in 1970. Special Trade Transactions in 1970 amounted to \$161,350,000, continuing the decline from the peak of \$322,000,000 in 1966. The proportion of total imports represented by Inedible End Products rose from 37 p.c. to 62 p.c., the corresponding reduction being borne by other sections. Food, Feed, Beverages and Tobacco and Inedible Crude Materials, each of which accounted for about 8 p.c. of total imports in 1970, had represented 12 p.c. and 24 p.c., respectively, in 1950. Proportionally, Inedible Fabricated Materials narrowed from 26 p.c. to 21 p.c.

From the viewpoint of the stage of fabrication, imports of crude and fabricated materials accounted for a steadily decreasing proportion of total imports, dropping from 30 p.c.

each in 1950 to 13 p.c. and 22 p.c., respectively, in 1970. On the other hand, imports of end products expanded their relative importance from 39 p.c. to 65 p.c. Thus, nearly two thirds of Canadian imports are currently end products, prominent among which are heavy machinery, equipment and tools required for capital investment in and operation of Canadian industries, together with the important group of automotive products.

From an already commanding position of 67 p.c. in 1950, the share of Canada's total imports from the United States rose further to 71 p.c. in 1970. The proportion of crude materials imported from that country declined from 57 p.c. to some 49 p.c. of the total imports of crude materials, whereas its share of fabricated materials and end products rose slightly from 63 p.c. to 64 p.c. and from 77 p.c. to 78 p.c., respectively. The share of the United Kingdom in Canadian imports fell from 13 p.c. in 1950 to about 5 p.c., all stages of fabrication contributing to the decline. Canada has recently been importing rapidly rising quantities of fabricated materials and end products from the European Economic Community and some Pacific Rim countries, notably Japan.

**Conclusion.**—It has been recognized that the Canadian economy has been in a rapid process of diversification, attaining a high level of sophistication in its industrial development and supporting a broadening spectrum of industrial activity for both the home and the export markets. In the process, primary products are becoming progressively less important in Canada's foreign trade. End products, in contrast, have expanded their proportion in both exports and imports, due in particular to the increased two-way flow of automotive products arising from the Canada-United States Automotive Products Agreement of 1965.

A shipment of 330 European automobiles crossing Nova Scotia after entering the country at the Port of Halifax.

## PART III.—THE GOVERNMENT AND FOREIGN TRADE

### Section 1.—Federal Foreign Trade Services\*

Canada's economy continues to be vitally dependent on external trade. Trade brings prosperity, and with it the key to developing and expanding social programs, upgrading educational, medical and cultural standards, and narrowing regional disparities. But export growth is not easy to achieve. Competition among industrial nations is intense and will become more so. Although there is no panacea for this problem, a successful export trade can be assured by combining good products, efficient production and aggressive, intelligent marketing with government support.

Federal Government support is provided through the Department of Industry, Trade and Commerce and the Export Development Corporation. The Department assists Canadian industry throughout the complete cycle—from research, design and development through production to marketing of the finished product. The Export Development Corporation, a Crown agency which reports to Parliament through the Minister of Industry, Trade and Commerce, provides insurance, guarantees, loans and other financial facilities to help Canadian exporters.

**Industry, Trade and Commerce Units Involved in Export.**—These units are: the General Relations and Area Relations Offices, the Industry, Trade and Traffic Services, Fairs and Missions, International Defence Programs Branches, and the Trade Commissioner Service. The Publicity Branch and the Office of the Industrial Policy Adviser have both international and domestic responsibilities. The Department's nine line branches, divided into Commodity Sectors, are concerned with promoting growth and efficiency in Canadian manufacturing (see Chap. XV, pp. 779-785), in addition to being active in trade development.

The *Office of General Relations* includes a General Trade Policy, a Commodity Trade Policy and an International Financing Branch. The Office is responsible for advance planning of Canada's external trade policies and general trade policy affecting both primary and secondary manufacturing. It is also responsible for the planning, negotiation and administration of intergovernmental commodity agreements requiring close contact with representatives of Canadian producers, importers and industry associations. The Office participates in the development of policies and procedures for external aid, export credits and other export financing arrangements. It keeps Canadian exporters informed about the range of financing facilities provided by the Canadian Government and those available through international organizations.

The *Office of Area Relations* protects and improves the access of Canadian goods to export markets. It participates in the development and conduct of Canada's external trade relations, and in the formulation of Canadian trade policy. It also ensures that Canada's trading relationships with individual foreign countries and trading blocs are taken into account when domestic economic programs are being worked out. It is concerned with tariffs and other government activities that affect international trade. As a service to Canadian exporters, it supplies details on rates of duty, import restrictions, documentation requirements and other foreign government measures affecting Canadian exports, and advises on problems encountered by exporters in dealing with these matters. Canadian businessmen may also obtain from this Office information on economic and trading conditions in all parts of the world and assistance in planning visits to foreign markets.

The *Industry, Trade and Traffic Services Branch* consists of four Divisions: Industrial Traffic Services, Export and Import Permits, Import Analysis and Industrial and Trade Enquiries. The Industrial Traffic Services Division conducts a continuing study of shipping problems which affect trade, unitized cargo concepts, air and ocean freight rates and services, and air cargo utilization by geographic areas. The main purpose of the studies is to find reliable transportation at competitive rates for external trade. Another objective

\* Prepared in the Canadian Division of the Publicity Branch, Department of Industry, Trade and Commerce, Ottawa.

is to help exporters select the most advantageous routes for moving their goods. The Division participates in international forums dealing with the movement of goods by sea.

The Export and Import Permits Division administers trade controls under the authority of the federal Export and Import Permits Act. The intention of the Act is to ensure, by export control, an adequate supply and distribution in Canada of goods necessary for defence or other needs. The Act also prevents any commodity sale that might be detrimental to the security of Canada. Other functions of this Division are to advise exporters on interpretation and requirements of the Export Control List and Regulations, to study the economic implications of the Export and Import Permits Act and to review control lists and practices.

The Industrial and Trade Enquiries Division provides foreign-based Canadian officers and trade development officers in Canada with appropriate information about Canadian products and companies. It maintains a multi-purpose data bank of Canadian companies and their export products. The Division provides guidance in matters not related to a particular commodity, such as the licensing of manufactures abroad, and assists businessmen unfamiliar with the operations of government by directing them to the appropriate department or agency.

In addition, the Industry, Trade and Traffic Services Branch administers the Department's eight regional offices, which are located at Halifax, Fredericton, Montreal, Toronto, Winnipeg, Regina, Edmonton and Vancouver.

The *Fairs and Missions Branch* co-ordinates, plans, organizes and manages departmental trade promotions designed to stimulate the sale of Canadian products and services abroad. This is achieved by participating in international trade fairs and in-store promotions, and organizing trade missions to and from Canada. Each of these promotional techniques has a specifically defined objective to fit a particular requirement. Fairs abroad are utilized to display Canadian products and cover a broad spectrum from electronics and computer equipment to frozen foods, from ocean technology hardware to clothing, and from wood products to cattle. The Department provides promotional publicity and a highly organized exhibit setting. In-store promotions may cover a single consumer product such as frozen food or a broad range of products to be displayed in either large or small stores.

Missions vary in type depending on the requirement but, in general, out-going missions are used for market investigation and evaluation, resolution of technical market access problems, and economic studies or display of samples; in-coming missions are designed to invite foreign government or company representatives who can influence buying to inspect the industrial capacity and technical capabilities of Canadian firms and to see examples of goods and services with the objective of effecting sales.

The Fairs and Missions program includes planned provision to capitalize on foreign market opportunities which cannot be foreseen in advance.

The *International Defence Programs Branch* promotes defence export trade through marketing programs aimed at the sale of Canadian defence and defence-related, high-technology equipment to friendly countries and the establishment of arrangements with Canada's allies for co-operative defence industrial research, development and production. A major activity is the Canada-United States defence-development and production-sharing program, which entails the joint development and reciprocal procurement of defence items. To ensure maximum Canadian industrial participation in United States defence programs, the Branch has offices in major American cities. Through specialists at Canadian missions abroad—including missions in London, Paris, Bonn and Rome and the Canadian Delegation to NATO—the Branch obtains access for Canadian defence products and technology to foreign markets.

The *Trade Commissioner Service* has 79 Trade Offices in 56 different countries. Its primary role is to promote Canada's export trade and generally to protect its commercial interests abroad. Accordingly, a trade commissioner is called upon to perform a wide variety of tasks: he acts as an export marketing consultant; brings foreign buyers into

contact with Canadian sellers; helps organize trade fairs and trade missions in his territory; recommends modes of distribution and suitable agents; and keeps his headquarters informed of changes in tariffs, exchange controls and other matters that might affect Canada's trade with that country. He initiates programs to develop the markets for those products with the greatest potential in given areas and handles enquiries from Canadian firms. At no time, however, does he handle any money since he is not an agent but rather provides personalized assistance to the Canadian exporter in his territory. In addition, he acts on behalf of the foreign programs of a number of Federal Government departments and undertakes agricultural reporting at specified posts.

For a Canadian firm considering a market in his territory, the trade commissioner can supply information on product usage in that territory, if any, on local production and import data for the product, and on prospective users and/or agents for it.

The scheduled return of trade commissioners for official tours of Canada is an effective means of imparting information to Canadian firms interested in export trade. Trade associations are informed well in advance of these visits so that appointments can be arranged. During such tours, the trade commissioner can discuss export problems with firms interested in exporting to his territory. Businessmen wishing to interview any trade commissioner on tour may arrange to do so by communicating with the Trade Commissioner Service, the Canadian Manufacturers' Association, the local Chamber of Commerce or Board of Trade, or one of the Department's regional offices.

The *Publicity Branch* supports foreign trade promotion by creating international awareness of, and demand for, Canadian products and by endeavouring to attract buyers to Canadian exhibits at out-of-country trade fairs. The program of the International Division is geared to attract buyers to Canadian exhibits at trade fairs. Trade and industrial publicity officers, each a trade promotion specialist responsible for publicizing various commodities, co-ordinate a sales-oriented promotion program on behalf of Canadian manufacturers. Their techniques include providing stories and pictures to foreign news media representatives, placing advertising in foreign publications and sending promotion material, such as booklets and brochures, to trade commissioners for distribution to businessmen in their territory. In addition, a public relations firm is employed in Paris.

Another service is *Canada Courier*, a full-colour tabloid-size newspaper featuring information and photographs about Canadian products and services available for export. Published in five languages, its 28 issues a year reach a total of 1,200,000 potential buyers of Canadian products. Two other publications, *Canada Commerce* and *Commerce Canada*, are produced monthly and contain reports on international market conditions, tariff and trade information, lists of actual export opportunities and domestic business activity. Both the English and French publications are available to Canadian business without charge.

The *Office of the Industrial Policy Adviser* is concerned with policies and programs that have a bearing on industrial development, including the effective adjustment of Canadian industry to changing conditions abroad and at home. The Office develops and maintains an up-to-date reservoir of intelligence on industrial policies in Canada and abroad and participates in the work of interdepartmental and international committees dealing with industrial policy matters.

The *Operational Branches* within the Department are Aerospace, Marine and Rail; Agriculture, Fisheries and Food Products; Apparel and Textiles; Chemicals; Electrical and Electronics; Machinery; Materials; Mechanical Transport; and Wood Products. Each line branch employs a group of commodity specialists who are responsible for assisting Canadian manufacturers to improve the quality and quantity of their production, and for promoting the sale of these products in domestic and world markets.

Each of these industry sector branches has responsibilities in the areas of export trade promotion and domestic industrial development. They lend assistance to Canadian companies already engaged in export activities and at the same time encourage companies with export potential to enter the highly competitive arena of international trade. Their industrial development responsibilities include conducting relative efficiency studies to

determine the competitive capacity of Canadian manufacturers, and assisting companies to participate in the Federal Government's various incentive programs aimed at expanding research, design development and innovation activities in Canadian industry.

**Office of Tourism.**—The Office of Tourism comprises the Canadian Government Travel Bureau and the Travel Industry Branch. The Bureau is charged with promoting travel to Canada from other countries; the Branch is concerned with the study and analysis of the Canadian travel industry, including Federal Government activities in support of tourism.

*Canadian Government Travel Bureau.*—To accomplish its primary function of attracting visitors to Canada, the Bureau undertakes extensive tourist advertising and promotion campaigns abroad, provides tourist publicity material for foreign newspapers, magazines, radio and television and film outlets, and works closely with travel agents and tour operators on three continents. It also maintains an extensive travel counselling service, providing brochures and information to about 2,000,000 potential visitors annually. Offices are operated in New York, Chicago, San Francisco, Minneapolis, Los Angeles, Boston, Philadelphia, Cincinnati, Buffalo, Cleveland, Detroit, Washington, Pittsburgh and Seattle in the United States; the Bureau also has offices in London, Paris, Frankfurt, The Hague, Mexico City, Tokyo and Sydney.

*Travel Industry Branch.*—The Branch is concerned primarily with Canada's travel facilities. Its duties entail close examination of the nature and extent of tourist facilities and services in Canada and appraisal of their adequacy to meet visitor expectations; the study of federal, provincial and private programs and policies related to the growth and development of the travel industry; assessment of industry strengths, weaknesses and problems; and the preparation of advice to the Minister on ways and means to aid the industry. Close liaison is maintained with federal and provincial departments and agencies having activities related to travel and tourism and with major elements of the private sector of the Canadian travel industry.

The Branch also keeps under review the tourism and travel policies and practices of other countries, studies trends and developments in international tourism, and concerns itself with the activities of international organizations and agencies that affect Canada's travel industry.

**Export Development Corporation (EDC).**—This Corporation, under authority of the Export Development Act (RSC 1970, c. E-18), succeeded the 25-year-old Export Credits Insurance Corporation on Oct. 1, 1969. It is the purpose of EDC to facilitate the development of Canada's export trade by providing insurance, guarantees, loan and other financial facilities that enable Canadian firms to meet international credit competition. It reports to Parliament through the Minister of Industry, Trade and Commerce, and its affairs are administered by a 12-man board of directors. The chairman and six of the directors are appointed from among persons employed in the Public Service of Canada and the remaining five from private business.

EDC functions are: to insure Canadian exporters against non-payment by foreign buyers due to credit or political risks over which neither buyer nor seller has any control; to issue guarantees to persons in respect of the financing of exports; to make loans to foreign buyers or to issue guarantees in respect of the purchase of capital goods or major services from Canada involving extended credit terms; and to insure Canadian investments abroad against non-commercial risks such as war or revolution, expropriation or confiscation, or the inability to repatriate capital or earnings.

Export credit insurance is available to all persons or corporations carrying on business in Canada to cover export sales made on customary credit terms. It provides protection against risks involved in the export, manufacture, treatment or servicing of goods for, or the leasing of goods to, a foreign customer; the sale or licensing of any rights in a patent,

trademark or copyright to a foreign customer; or the rendering to a foreign customer of any managerial, construction, technological, marketing or other such service.

The main risks insured include insolvency or protracted default on the part of the buyer; exchange restrictions in the buyer's country preventing the transfer of funds to Canada; cancellation of an import or an export licence or the imposition of restrictions on the import or export of goods not previously subject to restrictions; the occurrence of war between the buyer's country and Canada, or of war, revolution, etc., in the buyer's country. Comprehensive policies are available to cover general commodities sold on short credit terms up to a maximum of about 180 days; specific policies are issued to cover capital goods sold on medium credit terms up to a maximum of five years. Specific policies are also issued to cover services that are normally sold on a monthly or bi-monthly billing basis.

General commodities policies cover a policyholder's export sales to all countries for a period of one year and are renewable. Two types are available: the contracts policy, which insures an exporter against loss from the time he books an order until payment is received; and the shipments policy, obtainable at lower rates of premium and covering the exporter from the time of shipment until payment is received.

Capital goods policies cover specific transactions involving such goods as plant equipment, heavy machinery, ships, aircraft, etc. Specific policies are tailored to each transaction, but the general terms and conditions are the same as those applicable to policies for general commodities. Specific policies may also be issued to cover engineering, construction, technical or similar service contracts entered into between Canadian firms and persons

*Canadian radio relay communications equipment to the value of \$23,000,000 being manufactured in Montreal for export to Iran. The contract was financed by the Export Development Corporation as part of a \$100,000,000 line of credit agreement signed by the Imperial Government of Iran and the Corporation in 1971.*

in foreign countries who have agreed to purchase such services. EDC may also extend unconditional guarantees to any person who agrees to provide non-recourse financing in respect of an insured export sale of capital equipment on medium-term credit.

EDC insures exporters on a co-insurance basis, the exporter retaining a small percentage of the risk involved. The same principle operates in the distribution of recoveries obtained after the payment of a claim.

EDC is authorized to make loans to foreign buyers of capital equipment or services from Canada for which commercial financing is not available. In such transactions, the Canadian exporter applies for the loan on behalf of the buyer. The loan must normally be \$1,000,000 or more, and the credit terms required over five years. Guarantees may be given in respect of financing provided to a foreign importer of Canadian capital goods and services. EDC may also guarantee and, under certain circumstances, finance a portion of local costs involved in capital projects for which it has provided a loan or a guarantee.

EDC may insure Canadians investing in foreign countries against loss of the investment due to confiscation, inconvertibility or war. New investments of a lasting nature in developing countries qualify for such insurance and coverage is restricted to a maximum of 15 years. Investments may vary from that of the Canadian investor acquiring the right to share in the assets of a business carried on in a foreign country to that of the investor lending money to a person in a foreign country for the purpose of establishing a business in that country.

## Section 2.—The Development of Tariffs

Limitations of space in the Year Book have made it necessary, in regard to tariffs, to adopt the policy of confining any detail regarding commodities and countries to tariff relationships in force at present and to summarize as much as possible historical data and details of preceding tariffs.

### Subsection 1.—The Canadian Tariff Structure\*

The Canadian Tariff consists, in the main, of three sets of tariff rates—British Preferential, Most-Favoured-Nation, and General.

*British Preferential Tariff* rates are, with some exceptions, the lowest rates. They are applied to imported commodities from British countries, with the exception of Hong Kong, when conveyed without trans-shipment from a port of any British country enjoying the benefits of the British Preferential Tariff into a port of Canada. Some Commonwealth countries have trade agreements with Canada that provide for rates of duty, on certain specified goods, lower than the British Preferential rates.

*Most-Favoured-Nation* rates are usually higher than the British Preferential rates and lower than the General Tariff rates. They are applied to commodities imported from countries with which Canada has trade agreements. These rates would apply to British countries when they are lower than the British Preferential Tariff rates. The most important trade agreement concerning the effective rates applied to goods imported from countries entitled to Most-Favoured-Nation rates is the General Agreement on Tariffs and Trade (GATT).

*General Tariff* rates are applied to goods imported from the few countries with which Canada has not made trade agreements.

There are numerous goods which are duty-free under the British Preferential Tariff, or under both the British Preferential and the Most-Favoured-Nation Tariffs, or under all Tariffs.

\* Information relating to rates of duty, value for duty and anti-dumping duty is available from the Department of National Revenue, Customs and Excise, which administers the Customs Act, the Customs Tariff and the Anti-dumping Act.
